New Oric micros

ORIC Products International plans to launch three new computers in Spring 1985 — two in the under £500 price bracket.

The three comprise a £250 successor to the Atmos and two 8086-IBM compatible machines — one a £400 desktop model, the other a £3000 portable micro.

The follow-up to the Atmos, which had a working title of

Stratos (see Popular Computing Weekly, September 20) is to be called the IQ164 in this country. The IQ164, which, like the Atmos will use the 6802 chip, will have 64K Ram, but no internal Rom. Instead language cartridges can be plugged into two Rom cartridge slots provided on the machine. *Dr Logo* from Digital Research and Microsoft Basic will both be bundled with the machine.

It will have a Centronics printer interface, RS232C modem port, and a built-in disc controller.

"It will be 100% software compatible with the Atmos," said Oric's managing Director

Oric managing director Barry Muncaster

Barry Muncaster. "It will still be known as the Stratos on the continent, and we're hoping to launch it in France at the end of January. In the UK it will be launched around March or April and the price will be in the area of £250."

The IBM-compatible desktop machine will be available in several versions. The basic model will have 128K Ram and 32K video Ram, and be priced around £400, and rather like the Advance, be cassette software based.

Then the user can add on a dual floppy disc drive or a Winchester hard disc, and a colour monitor to up-grade up to IBM-compatibility and a full business computer. The full set will cost just over £2000, and CP/M software will be bundled," Barry Muncaster continued.

Finally, the new Oric portable IBM-compatible machine

Confusion over Coleco

THE future of Coleco's Adam computer is in doubt following a bizarre announcement by Atari Corporation (UK) that its main rival in the video game machine market, Coleco, is to pull out of the market. The Atari press statement claimed: "Coleco — the nearest rival to Atari's best selling 2600 Video Computer System — are withdrawing from the market place leaving Atari as the unchallenged leaders."

Yet Ideal Toys — which markets the Colecovision games machine which forms the basis of the Adam in the UK denied that Coleco had any plans whatsoever to leave the market:

"To say that Colecovision has been withdrawn is incorrect," said Philip Gibbs, sales manager at Ideal Toys. "It is very much still there in the market. Colecovision is also now very competitively priced with the Atari 2600 Jr and Jr machines. We recently made a dramatic reduction in price down to £49.99 — the same price as the 2600Jr."

continued on page 5▶

Problems for Amstrad's CP/M

IT looks as though Amstrad owners who wish to run CP/M programs with the disc drive, when it is released, could have problems.

Once the CP/M operating system disc has been loaded only 39.5K is left free for CP/M programs to run in. Yet by far the majority of CP/M titles require more than 40K to run.

"39.5K is certainly not a large

amount of space," said Chris Hall of Locomotive Software, which designed the Amstrad CPC846 computer. "Most CP/M micros leave around 50 to 54K. There may well be a number of programs there would not be room for."

Roland Perry, Amsoft's technical manager, said, "The most important aspect of the disc

Alice IN VIDEOLAND

NOW
ON
CASSETTE!

PURE MAGIC!

Join Alice in her journey through Videoland - an enchanted place populated by strange creatures such as bread-and-butterflies and pipe smoking caterpillars; where little girls change size and flamingos turn into croquet mallets!

Alice in Videoland is a revolutionary new concept in entertainment for the Commodore 64, incorporating some of the finest graphics ever seen on any home computer, accompanied by a charming musical score. There are four different game scenes involved, and your performance in earlier ones will affect your ability to get through later ones and determine your eventual total score.

Scene One - Stunning title page graphics give way to the first game scene as Alice falls into the rabbit's warren. Score points for collecting the objects to be found there - including keys to open doors, bottles to make her smaller, cakes to make her bigger!

Scene Two - Out in the garden the Cheshire cat looks on as Alice meets the pipe-smoking caterpillar. Help her to catch the bread-and-butterflies and the rocking-horse flies that change into the balls used in the croquet game in the last scene!

Scene Three - Alice is a pawn in the chess game where her opponents are the Jabberwocky and Tweedledum and Tweedledee. Help her across the board by protecting her with your White Knights!

Scene Four - The most bizarre croquet game ever! Help Alice hit the balls through the playing-card-soldier hoops before the Queen of Hearts stomps on them!

Alice in Videoland is available for the Commodore 64 on disk - £12.95, and now on cassette - £8.95.

Alice in Videoland features graphics created with the Koala Pad.

SEND FOR **FREE** COLOUR CATALOGUE!

Bruce Everiss — formerly of Imagine — commented this week that nobody seems prepared to take risks anymore.

It is good, therefore, to see Automata's outstanding *Deus ex Machina* in the charts for the first time.

This Christmas will see some of the most innovative software yet written — software which tackles the biggest challenge of all — how to add depth, humour, characterisation and emotion to the blobs on the screen.

Titles like *Gargoyle Games' Tir Na Nog*. Like *Deus* it is an attempt to produce an interactive film, but the results are entirely original. Rather in the style of an adventure, you control the brilliantly programmed central character as it moves around a maze of pathways. Cartoon animation of this quality has not been seen before — especially not on the Spectrum.

Another first-class package is *Ghostbusters* from Activision for the C64. This adds depth by 'spinning off' from the excellent comedy movie of the same name due for release in this country on December 7. But David Crane's game triumphs where all other tie-ins have not because, whichever way you look at it, it's a superb piece of programming. It remains true to the film's plot and its version of the Ray Parker Jr hit theme tune and its speech is a terrific achievement. Music like you've never heard before on the 64.

I don't accept that the 'spark' has gone out of the new software. It's just that for the most part, it is the newer companies that are now shining through.

All that is being proved is that once you've 'made it' and reached the top it is very difficult indeed to stay there.

Keyboard for C64

SIEL — the Italian music keyboard manufacturer — has produced a professional quality music keyboard add-on for the Commodore 64.

The keyboard can also be used in conjunction with SIEL's MIDI interface enabling it to be connected with and control other MIDI-equipped instruments. For example, the software can 'split' the keyboard into two sections with one

playing Commodore 64 sounds and the other taking voice/sound information from a separate keyboard.

SIEL intends its Commodore 64 keyboard to form the basis of a developing system. There are plans for a separate sound generator, a low cost MIDI expander to allow a number of different sound tracks to be developed at once, and additional software for sequencing and composing.

The basic package, consisting of the full-size 49-note keyboard and software on either cassette or disc is expected to retail at £125.00 and will be launched at the end of November.

Amstrad CP/M

◀continued from page 1

drive is as an extension to the micro — the CP/M is a bonus. As far as individual CP/M titles are concerned, it depends on the type of program as to whether it will fit. I don't know of vast numbers of programs that wouldn't run, although there will be restrictions.

"We envisage people using CP/M on the Amstrad more for languages and utilities, rather than large spreadsheets or stock control.

"However, we do know of one company which could convert existing CP/M programs to fit on the Amstrad. Original writers, too, may well modify the programs if there is the demand."

Amsoft itself will be releasing two CP/M packages, under the title Classic Business Applications. The first is provisionally planned to contain programs for stock control, sales invoicing, sales ledger, purchase ledger and nominal ledger. The second will contain an integrated database and word processor — *Micro Pen* and *Micro Script*.

Atari/Coleco

◀continued from page 1

In the US, a spokeswoman for CBS Coleco agreed: "Colecovision has not been withdrawn."

On Friday though, Atari UK's managing director, Simon Westbrook, said, "We have it on good authority that Coleco is withdrawing."

Oric

◀continued from page 1

will be priced at just under £3000. It will feature a built-in 80 column x 25 row screen display manufactured by Hitachi.

"We're hoping to be able to launch them all at the same time next spring. Also the prices at the moment are approximate because we're dependent on the fluctuation on the dollar between now and then."

Beyond to market Spy vs. Spy

FIRST Star's *Spy vs. Spy* game is set for release in the UK next week. Beyond Software is to market the game in the UK.

Spy vs. Spy is based on the American comic strip of the same name from the magazine *MAD*. "It can be played either by two players, or by one versus the computer. The scene is a maze of rooms in an Embassy; both players are looking for secret plans hidden in a briefcase somewhere in the maze," explained Beyond's Clive Bailey.

Beyond's agreement with First Star does not affect the US company's deal with Statesoft

Ultimate releases 3D adventure

ULTIMATE'S follow-up to the recently released *Underworld* is now available, entitled *Knight Lore*.

The game uses three dimensional graphics of outstanding quality, and comes very close to being a true interactive cartoon.

Set in a 128-room castle, the player's task is to collect objects and bring them to one

particular room in the castle where a wizard presides over a cauldron. The objects must then be deposited in the cauldron in a certain order.

By night the player turns into a werewolf. After forty playing days, if the player has not collected the objects, the game is lost, as the player becomes a werewolf permanently. With the werewolf persona, travel in the castle is difficult and dangerous.

Knight Lore is available on the Spectrum, and priced at £9.95.

Versatile plotter from Penman

PENMAN, a new low-cost three-colour printer/plotter, has been launched by Penman Products. A unique feature of Penman — which costs £199 — is its mode of operation. Up to three pens are carried on a remote robot unit, which is connected to the control unit via a flexible ribbon, and moves around the drawing surface.

Controllable from Basic by any micro with an RS232 port the remote pen unit can be used as a turtle, mouse, robot or primitive text digitiser. Its design has earned it a place as

a finalist in the Prince of Wales Awards.

Application packages are available now to use the Penman printer/plotter with the BBC B, Apple II and IBM PC with versions for most other popular machines to follow.

Further information from Penman Products, 8 Hazelwood Close, Dominion Way, Worthing, W Sussex.

which markets other First Star products in the UK, such as *Astro Crash* and *Flip and Flop*.

Explained Statesoft's John Fletcher, "First Star did offer us *Spy vs. Spy*, and while we considered it, we didn't feel we could do justice to it."

Spy vs. Spy will be initially released for the Commodore 64, at £9.95 for the cassette version and £11.95 on disc. A Spectrum version is being planned for next spring, and Beyond is also considering converting the game for the Amstrad.

Prism expands Micronet for C64

PRISM has now officially launched its viewdata system to enable Commodore 64 owners to down-load software from the Micronet 800 database.

The Commodore 64 micronet system is based on Prism's Modem 1000. The viewdata software included in the package is supplied on a Rom cartridge which fits into the C64 expansion port.

The software will also

enable 64 owners to access the Prestel and Viewfax 258 networks and allow contact between Commodore users and Spectrum and BBC users. Details from Prism Microproducts, Prism House, 18/23 Mora Street, City Road, London EC1.

The system costs £129.95. ●Bob Denton has resigned as group managing director of hardware distributor, Prism Technology Holdings.

"Bob decided he wanted to go his own way after 2½ years of setting up and developing Prism," said Richard Hease, who will take over the managing directorship. "However, he is still a large shareholder and will continue as a non-executive director."

ZX Microfair

THE Christmas ZX Microfair takes place this weekend — open on Saturday and Sunday November 17-18 — at Alexandra Palace in North London.

The show begins at 10.00 am both days and admission will be £1.50 for adults and £1.00 for kids.

WILDEST DREAMS

Software Rental

Just a couple of questions for the computer gamer

1. When did you buy your last computer game?
2. How often have you played it?

LITTLE JOHNNY'S POCKET MONEY DAY

...BUYS HIS WEEKLY SINGLE TAPE

...BUT IT'S ANOTHER LEMON

FLOPS IT TO DARREN NEXT DOOR WHO DOES A ROARING TRADE IN 2ND HAND GAMES

LITTLE ROGERS SPENDING MONEY IS A BIT LESS

BUT HE'S HEARD OF WILDEST DREAMS SOFTWARE RENTAL

SO HE GETS LOADS OF PROGRAMS FOR HIS MONEY

AND HAS A BRILL TIME

Buying software can seem a pretty bad deal when you pay £5.99 for only a couple of hours play.

Well, now you can visit the Circus, help King Clive in his dungeon, beat the computer on your Lazer Byke, explore deep space, eat your way through a cheese warehouse and get totally infuriated by the Mazeball, all for less than the price of one new cassette.

How? well, if you go down to your Video dealer today, you're in for a big surprise. He can hire you a Wildest Dream rental cassette for your Spectrum or Commodore 64, featuring one of these games, at a very reasonable price (say about one tenth the price of a good recent game ...)

And its not somebody else's old stock were trying to hire you. These are all brand new games that you've never seen before in the shops - and you won't see them in the shops later.

Only through your local Video dealer can you hire Wildest Dreams rental software.

QLUB complaint

I have a complaint relating to the Sinclair QL, not about the QL itself, as it is basically a very good machine, but about the QLUB.

Hopefully two-thirds of QL owners — as that's the fraction of QL owners who have had the same misfortune as I have had to part with £35 for QLUB — will join me in denouncing the QL Users Bureau rip-off.

Firstly, the bi-monthly newsletter providing technical tips and suggestions for applications of QL software does not exist. I've had my QL for a quarter of my year's membership and all I've received is a membership card. Secondly, why do we need up-dates to the Psion packages under QLUB, when it is quite obvious that many non-QLUB members will need replacements (which the guarantee covers) because the originals occasionally crash. Thirdly, I have never used the Psion software assistance, mainly because the programs are straightforward so there is no need.

Also if a non-QLUB member did experience a legitimate problem I am sure Psion would help anyway.

Come on, Sir Clive, what have you done with our £14million — if it is still in the

bank we would like a refund, please.

Raid over Moscow

I was outraged to see the advertisement for a program called *Raid Over Moscow* in your November 1 issue.

I am surprised that this ad was allowed to appear in the same magazine as the Automata ad with lines in it like "the Soviets believe their treachery will lead to total world domination."

The only saving grace was that the program was American-released through US Gold — I am pleased that no British company would

stoop so low.

I hope to see a non-political *Popular Computing Weekly* in the future with more advertisements for decent peaceful programs.

More homework

Regarding Jagdeep Sandu's letter, he should do more homework. The first serious software purchasable, namely Metacom's Editor-Assembler, proves all the critics wrong. Using these programs with, say, 256K memory expansion it will be possible to edit five or six test files simultaneously, all in individual fully scrollable windows whilst at the same time running a Basic program, assembling source code to a microdrive file and running an on-screen clock! These facilities are available to a lesser extent with normal memory due to the large size of the programs, but they are still extremely impressive. If this isn't multi-tasking with 'full' windows then I don't know

what is.

On benchmark averages the QL is about 6% slower than the BBC — a small price to pay for a Basic which is more extensive and far more user-friendly. Anyway, nobody writes in Basic if they want speed. A 68008 processor running at 7.5MHz is infinitely more powerful than a 6802 running at 2MHz. Machine code written on the QL will run (with suitable drivers) on any 68000 machine and even on machines which will appear in the near future using the new 32 x 32-bit 68032 chip which is the most powerful microprocessor in the world. Which potential main-frames is the BBC upwardly compatible with?

And regarding expansion, the QL is in a different league. When will the BBC ever directly access 1M of memory? Look at the range of add-ons that Quest have just announced. Using the standard expansion bus, in the not too distant future people will connect the 68881 maths co-processor (although the QL is faster than any sub £3000 non-68000 machine in this area, anyway) and the 68486/68487 video chip combination.

All the above is better and cheaper than the BBC equivalents will ever be.

All I can do, Mr Sandu, is to offer you £20 scrap for your BBC — I could make better use of the Ram chips!

John Lawlor

Inverurie
Aberdeenshire

Renumber carefully

A warning to QL users: be careful how you use the *Renumber* command.

I was writing a large program which contained a few *Goto* statements. On Renumbering those *Gotos* to unwritten lines, the following occurred: 100 GO TO 101 → *Renum* → 100 GO TO 32767
100 GO TO 10 → *Renum* → 100 GO TO 100.

Is it all a plot to make us give up *Gotos* in favour of procedures?

Win a ZX Spectrum +

Just in case you missed last week's issue we are offering a chance to win a brand new ZX Spectrum +, complete with its six bundled software packs — worth £179.95.

All you have to do is correctly identify the eight software programs which appear in Sinclair's current TV advert for the Spectrum +.

Fill in the form below with the eight titles and send it off to 'Sinclair Competition', *Popular Computing Weekly*, 12-13 Little Newport Street, London WC2R 3LD, to reach us no later than midday on Friday, December 2.

There is also a tie-break in case more than one entrant gets the eight program names correct. Read the idea for a new Sinclair game and think up a good title for it: 'As an heir to a vast fortune you have to find and piece together the fragments of a portrait distributed around an isolated mansion.' The judges decision is final.

Battleships

Batten down the hatches as you fight it out with your Amstrad
CPC 464 in Battleships by Steve Lucas

This is a computerised version of the familiar game of Battleships in which you and your opponent hide five ships on a nine by nine grid. Each location on the grid is given a co-ordinate name such as A4 (letter first) and you must take turns with your opponent (the computer) to fire torpedoes at your opponents grid. The winner is the one who sinks all their opponents ships first.

When typing in this program, take care to distinguish between the variable **I** (lower case **I**) and the number **1**.

I decided to make the computer play a rather dumb game so as to give you (the player) a chance of winning! You could make the game more difficult by altering the routine which searches for your ships (Lines 1960-2150).

Program Notes Conversion

The program makes use of many special commands available in Amstrad Basic.

The **While Wend** loop could be replaced with either a **Repeat Until** loop or a conditional **Goto**. Note that the **While Wend** loop checks for the condition at the start of the loop, whereas a **Repeat Until** loop checks the condition at the end of the loop.

Lower\$ converts a variable to lower case, while **Upper\$** converts a string to upper case. **Locate X, Y** moves the text cursor to position **X, Y**. This is equivalent to **Print Tab (X, Y)** on the BBC, **Print At** on the Spectrum and **Plot x, y, A\$** on the Oric.

Ink is used to select the four colours available in the palette for Mode 1, a 40 column mode. **Paper** and **Pen** choose foreground and background colours from the **Inks** available.

The Amstrad interprets upper case and lower case variables as being identical.

Variables

cc	holds computer score
yc	holds your score
a\$(x,y)	holds computer's board
b\$(x,y)	holds names of ships
c\$(x)	holds input co-ordinates
d\$(x)	hold co-ordinates

Behind the screens

Christina Erskine talks to John Sutherland of Acorn Video

Launched in a small flurry of publicity a few weeks back, Acorn Video — the new subsidiary of Acorn, set up to look at interactive video systems — has actually been planned for over two years.

The company was formally established in October this year with John Sutherland at the helm. John was brought in as a part-time managing director on the strength of his considerable management and business experience — he was managing director of Marconi Radar for 14 years before taking early retirement.

"Before the company officially existed, we did a lot of research into the exact form Acorn Video should take," said John. "We talked to a lot of companies, users, educationalists, prior to getting going."

Interactive video means connecting a standard videodisc player to a computer. Specially written software enables the computer to control the screen images. The user can select which frames of the video to show in which order.

This technique had been used to good effect in some arcade games, notably *Dragon's Lair*, and *Hiachi's Golf Game* on MSX, when connected to video disc.

"Acorn felt that the potential market for interactive video was large enough to warrant setting up a separate company rather than developing the products within Acorn. It was partly also because our market is going to be very different from that which Acorn usually deals with."

"With Acorn Video, we are not selling the home market. Our main selling area is to companies, for example, for training and educational applications."

Training videos being now largely commonplace, certainly in larger companies, I asked exactly how the interactive facility and the micro were going to fit in to the system already used.

"The great strength of interaction is that you can fit the running of the video to the trainee's ability," explained John. "You can use menu-driven routines from the menu to interrupt the running of the video and ask the trainees if they understand what they have been shown, if they would like any parts repeated. It could test their understanding with a series of questions at the end of each section."

"Most importantly, it gives the facility to include sound, as in a commentary, with images, with superimposed graphics. For example, say we have an interactive video showing how to change a car wheel. The trainee keeps forgetting to tighten up the wheel nuts fully afterwards, one can add flashing arrows pointing to the wheel nuts at the right moment. One could even flash up words such as 'No, stupid — you're still

doing it wrong' if you really wanted to."

The Acorn system, which will be available before the end of the year, will be the first such dedicated system to be produced.

The basic system — based on BBC micro — will give the facility to include the interactive element, since many companies already have videodiscs in use. However, the company is not ruling out the possibility of tailoring software to meet customers' needs.

Already, Acorn Video is negotiating with about 20 companies which are interested in its work, and two major industrial users are planning to take 50 interactive video systems on approval. John is certain that they'll not only want to keep them, but also order more.

Two versions of the system are to be produced, one completely self-contained package — the so-called Delivery system — and one where it is possible for the operator to overwrite the software with commands, graphics or information of his or her own — the so-called Authorship system.

Each package will consist of a modified BBC micro linked to a Philips Laservision video disc player. The BBC micro has a 'microtext-plus' processor, video synchronisation board and video command chip added internally and comes with a special Microvitec monitor, with the ability to present sound, text, image and graphics together. This is coupled to the Laservision laserdisc player controlled by a special Acorn Author software package.

For the Authorship version of the video system, the above hardware is supplemented with an Acorn Bitstick and 6502 second processor, enable new material to be written into the Author program. The

complete system — as you would expect — is quite pricey. The basic training machine and software will cost around £3000. The more versatile Author version about £4000.

John is also interested in selling the interactive video system as an educational aid in schools. "Obviously there is great potential to use the system in schools, and we may well implement a scheme whereby we can take in ordinary BBCs from the schools and adapt them to run the interactive video packages, but that isn't fully decided yet."

In the longer term, the company is also looking at the use of the system for sophisticated data retrieval.

"The possibilities of committing images, text and graphics to laserdisc are enormous. It would enable information that you would find in, for example, illustrated text books, much more flexible. It is now well accepted that works such as the Oxford English Dictionary are being computerised in a fairly conventional database form. There are other works which are ideally suited to presentation with interactive video. Gray's Anatomy, which is a standard medical textbook, being put on to laserdisc. The implications of being able to use it in the same way as the interactive videos are obvious — it will be tremendously helpful to students. Another area where there seems to be vast potential is with geographical applications, where maps or charts can be enlarged, rescaled, where towns or even individual streets can be picked out and studied in detail."

Acorn Video is also planning to include the interactive video system as an option in Acorn's new ABC range of business micros, with a separate machine, the AIVSD, containing all the interfaces, video command boards, special monitor, etc, in the one machine.

To achieve all this, Acorn's newest company must expand from its present staff level of nine — and is planning to employ 25 people by the middle of next year.

The Acorn Video team (left to right): Geoff Wood, John Sutherland and Michael Grove

Touchdown

Program American Football
Price £8.95 **Micro Spectrum**
48K **Supplier** Softstore, Suite 1,
39c Paddington Street, London
W1

Gee, just a month ago I was calling the plays in a single game of *Pro Football*, courtesy of Argus Press Software and now I'm coach for a whole season, with my sights set on the Superbowl. Channel Four sure have a lot to answer for!

Softstone's strategy game is similar to Addictive's perennial *Football Manager*. You choose teams, transfer players, arrange loans, then sit back and watch the game highlights.

One thing is immediately obvious — this is no simulation! Instead of having 49 players to choose from you have only 16,

and team substitutions are further limited to only one prior to each game.

I was then annoyed to reach the Superbowl only to find I couldn't change my team at all for the big match. And a save routine is a must in a game like this, so why isn't there one?

The game scenes are jerkily animated by block graphics, which almost totally fail to capture the strategies of the sport, reducing it to 'Dropped Ball' or 'Touchdown'. The least said about the '3D' pitch markings the better.

After which, it may seem strange to admit that *American Football* can be quite fun as it works smoothly and quickly with nice sound, but I still can't help feeling that its subject could as easily have been Rugby or even Croquet.

John Minson

Evil eyes

Program Styx **Micro Atmos**
Price £8.50 **Supplier** No Man's
Land, 110 Bis av du General-
Leclerc, 93500 Pantin, France

This has a familiar format. The enemy to be destroyed flutters around the screen, you have one weapon, the ubiquitous laser gun, and commands are Left, Right and Fire. Well, the games moves smoothly enough but there is nothing unusual in this *Invasions* type game.

In four screens you have to destroy the Eagles, Goblins and Evil Eyes, the Eyes being the most difficult to hit because of their habit of disappearing. The only significant

difference in the three is their shape. They all flutter about randomly dropping bombs and floating mines which disappear if you shoot the randomly appearing Vulture.

The final screen is the magnificent 'Castle of Hell on the River Styx'. You can shoot away the defence, but you are continually harassed by a multitude of suicidal flying things, many of whom fall in battle before they have the sense to start bombing you.

The action is swift and smooth, and the first round of four screens not so difficult to complete, but after each round the attacks just get faster and faster. For arcade addicts only.

Vic Fielder

Bags of gold

Program Castle Assault **Price**
£6.95 **Micro Electron Supplier**
MRM Software, 17 Cross
Coates Road, Grimsby DN34
4QH

When I read the cover of the cassette and looked at the very colourful picture, I was keen to get out the cassette, load up and enjoy what the picture and blurb persuaded me was to be an exciting, horrifying game.

Well, to be fair, if I'd looked more closely at the cover I'd have noticed a small picture of the 'real' screen picture and got a better idea of the game.

It's one of those jump-over-the-monsters — climb-the-lad-

ders — over the moving platform — watch out for the flying ducks-type of game. If you can do all of that you are rewarded with bags of gold and bonus points.

I found it needed a great amount of either skill or co-ordination between forward movement and jump in order to get over the first level of menies.

Once over these you climb a ladder and traverse a moving platform. You have to repeat this process three times before you reach the top of the castle and get the gold (provided you also miss the flying duck). It's a fairly interesting game and should keep newcomers to this type of game absorbed for a while.

Fred Short

Skeletons

Program Fred **Price** £6.95 **Micro Commodore 64 Supplier**
Quicksilver, PO Box 6, Wim-
borne, Dorset.

Maze games are one of the most popular formats for arcade games. *Fred* from Quicksilver is one of the latest of this type to join the large number already available. The content of the game is much the same as usual, but the theme is perhaps a little different.

The setting is in the catacombs inside one of the ancient pyramids. You have to guide Fred round the maze-like passages, collecting the treasures and avoiding the hazards. These take the form of things like skeletons, mummies and something that looks like an animated chef's hat (but it is

probably supposed to be a ghost). To escape from the maze, you must find the bomb (there is one in every Egyptian pyramid of course!), and then you can blast your way out of one maze into the next one.

The action is reasonably tricky, without being really challenging, but one thing is really very difficult, and that is finding your way out of the mazes. The graphics and sound are OK, but not really up to the best quality that can now be found on the Commodore 64. The game follows the usual and irritating Quicksilver standard of having its instructions separate from the rest of the game, making reference to them impossible after the game has loaded. This poor piece of design is compounded by the lack of any helpful details on the cassette insert.

Richard Corfield

High spec

Program Assembler Price
£39.95 **Micro QL Supplier** Metacomco, 26 Portland Street, Bristol.

This is the first assembler available for the QL, and comes with a high specification — and a price to match.

It has been converted from other 68000 machines, and has been compiled using BCPL, so is rather larger than the equivalent in machine-code would be. It consists of two parts: a screen editor, for entering source code, and an assembler for converting it.

On the standard 128K model of the QL, there is not enough room for both to be in memory at the same time, which is a big nuisance. In addition, the assembler is in three parts, loaded as overlays, which slows down its operation somewhat.

Both programs are loaded as multi-tasking jobs, using *Exec* or *Exec-E*, so you can, for example, edit a file in one window while running a Basic program in another.

The editor looks extremely good, using a user-definable window, with sensible use of the cursor keys to delete text in characters, word or lines, and for rapid movement around the file. There are the usual sort of commands, such as *Search* and *Replace* and margin settings. Unlike *Quill*, the editor uses standard ASCII notation and you can use it to edit anything else, including Super-Basic programs. It differs from *Quill* in two other ways — it is very much faster, as it doesn't use overlays and handles the microdrives properly, but it doesn't have any justification facilities, so true wordprocessing is not possible.

The assembler consists of three overlays — the first is to set-up options, the second is the work-horse for actual assembly, while the third is responsible for printing the error messages at the end of assembly. The net result of the overlays is that it is a pretty slow process for small programs, though for larger ones the overlay loading time is

small compared to the actual assembly time.

The assembler itself has a very high specification, with many advanced features. It supports Macros, to ease code repetition, nested conditional assembly, various print-out options, and a *Get* facility for linking files together. There is also the ability to externally reference labels for linking to other packages, but this is a little academic until something else appears with a compatible feature, such as a language compiler. There are four assembler options, which include automatic position-independent code, and relocatable code using a linker.

Label names can have up to 30 significant characters, which I feel is rather an excessive quantity. A smaller number, such as 16, would have increased assembly time while reducing storage requirements, with little restriction placed by the assembler.

As position-independent code can be selected as automatic, PC mode never has to be specified in an instruction, which is very useful, but if you should type in an instruction following the Motorola standard actually including PC, it gets rejected, which is very annoying.

The 68008 has certain sets of similar instructions, such as *CMP*, which can exist in three different forms. *CMPA*, *CMPI* and *CMPL*. It is normal for 68000 assemblers to work out which one is necessary from the following addressing modes, but unfortunately the Metacomco one falls down badly in this respect. No automatic conversion is done at all, which makes programming much slower than it should be.

In my view, the editor is very nice indeed, but the assembler, while having many advanced features, does not conform to the standard on the simpler instructions.

The final factor to consider is the cost at £39.95. It is certainly a bargain compared to other 68000 systems, but it may be off-putting to many owners of a machine costing £400.

Andrew Pennell

Redheaded

Program Fire Rescue Price
£7.95 **Micro MSX Supplier** Kuma, 111 Horseshoe Park, Pangbourne, Berks.

Any new MSX user buying *Fire Rescue* is likely to be very disappointed. It is not a good game.

The screen consists of a cross-section of a building, the five levels being connected by ladders. Your task as a sweet ginger-haired little girl (this I could identify with) is to rescue

a teddy-bear from each level by pulling him along and throwing him down a lift shaft.

Rescuing all five teddies lowers a ground floor ladder to the basement, allowing you to escape and live to shuffle another day or to a harder screen. These involve avoiding

fatal fireballs and so on.

This might keep the five-year-olds entertained for the afternoon, but is unlikely to hold the attention of anyone who has made it out of the sand-pit.

Joanna Gordon

Gummed up

Program Poster Paster Price
£5.95 **Micro Commodore 64 Supplier** Taskset, 13 High Street, Brndington, York

It makes a refreshing change to come across a new program which is genuinely a bit different from the run of the mill computer game. *Poster Paster* from Taskset is both different and very enjoyable.

In this game you play the part of Bill Stickers (get it?) and your job is to paste posters on all the hoardings in town. You are supplied with a box of posters, paste, a brush and ladder. Most of the posters are made up of

several pieces which must be correctly positioned on the hoarding if they are to stick. Trying to stop you are Gnurds, Wazzocks and Drain Brains. Contact with any of them is fatal, but you can destroy them by flicking paste on them.

There are 12 phases in the game, becoming progressively more difficult with larger and more complicated posters, and more numerous and persistent Wazzocks, Gnurds, etc. Three skill levels are provided, but even at the easiest, it takes a little while to get the hang of it. However, it is well worth the effort because the game is great fun and rapidly becomes very addictive.

Richard Corfield

Dodgy motors

Program *New Wheels John?*
Price £5.00 **Micro Spectrum**
48K **Supplier** Automata, 27
Highland Rd, Portsmouth,
Hants.

This is the latest flight of fancy from the Automata stables, in which you can "wheel and deal, duck and dive, cut and shunt" in the Used Car trade. If you have ever enviously looked on as Arthur Daley neatly palms off some dodgy motor on an unsuspecting punter in yet another repeat of *Minder*, then this is the game for you.

In a nutshell, it is a business strategy game with a sense of humour. In a rather long opening sequence, you are given some initial capital, an overdraft, choice of trading premises, staff, opening times, and naturally, gender.

You go on to buy used cars at

auction or from the trade...and finally you wait in your shop for the punters to arrive. The punter will either ask for a particular make of car, or state a particular price. It is up to you to have a varied enough stock to be able to make a sale.

The game is played day by day, with the minimum playing

time being a year. This takes several evenings to complete, but the game allows you to save tape, plus the option to dump the screen display of your stock to printer, allowing you to plan your wheeling and dealing overnight.

Make no mistake, *New Wheels* has some nice touches...visits from The Bill and neat end-of-the-month accounts, but in the end I found it repetitive and boring.

Having said that, if you are a whacky accountant looking for a game to while away the winter evenings, then look no further.

Joanna Gordon

Worthwhile

Program *Dbug Micro Atmos*
Price £11.95 **Supplier** No
Man's Land, 110 Bis av du
General-Leclerc, 93500 Pantin,
France

Dbug is a machine-code monitor and de-bugging utility which includes a number of extra features making it one of the best available for the Oric/Atmos. The 30 commands fall into three categories: monitor, de-bug and system commands.

The monitor section has all the usual facilities to enter and display hexadecimal bytes,

and the *Evaluate* command gives the sum and difference of two numbers in both hex and decimal as well as simple conversion. Using copy memory and compare memory commands it is easy to transfer and modify existing code. The find command searches for a string of up to eight bytes and will search all 64K of memory in less than three seconds!

System commands control the screen which can be set to *Hires* or *Text* and the *Ink* colour can be changed. The *Line* command limits the number of lines on the screen that are scrolled enabling a window to be left at the top.

Cross-eyed

Program *Gauntlet Price* £6.95
Micro Spectrum Supplier Micro Power, 15 Sheepscar Street
South, Leeds LS7 1AD

It seems that lately it has been too easy, when reviewing a supposed new game to be able to divulge that far from being new it is really an old one, renamed. Well, yes, *Gauntlet* is the BBC version of *Planetoid* but this time I'm quite "over the moon". If there is, as it would seem, nothing new, then let's have the good old ones back.

Gauntlet is a chance to fly, at high speed, across an alien planet and literally run the gauntlet. You fly your X16 over the desolate landscape to protect the Cannisters from the attacking forces of Landers who follow the shape of the landscape in search of Cannis-

ters. If a Lander grabs a Cannister and succeeds in carrying it to the top of the screen it turns into a Mutant.

To help with all the action you have on board your craft a laser gun of devastating power, a smart bomb to blast everything in sight, a hyperspace button to get you out of tricky situations, and forward and reverse motion.

Points are awarded for shooting/blasting a list of ten various enemy objects ranging from a Lander for ten points ■ Cannisters for 80 points.

I liked the high speed flying and fast action laser shooting, but went cross-eyed watching a radar screen version of the scene at the top of the screen.

The deceptively simple screen lay-out belies a complicated full of action game which I for one have spent many hours enjoying.

Fred Short

Time for bed

Program *The Magic Roundabout Price* £6.95 **Micro Spectrum**
48K **Supplier** CRL Group,

Do today's children still watch *The Magic Roundabout*? CRL think so enough to bring out this game, and not before time. After all, Dougal the dog is as big a hero as all the Willys and Wallis put together.

Here Dougal is also a sprite though, moving among lots of other sprites in the Magic Garden. He is trying to build a house of sugar lumps before bedtime, but he has to keep eating the sweet stuff to keep his strength up.

Meanwhile Florence, Brian

Finally the de-bugging facilities offered allow for ten break-points, register display and modification and single stepping through a program. This last feature is especially useful and can be set to execute every instruction or to ignore any JSR's. At each step

and his other friends cause fatal collisions unless they are driven off by his bark. Does this all sound a good idea? Well it is, but it's not been given the treatment it deserves.

Without any sort of 'radar' it is difficult to locate off-screen sugar but the deadly crashes occur too easily. Often it is impossible to escape from these until soon all three lives are gone.

Colour choice is not desperately clear and the sound is a great disappointment, with not even a hint of the *Magic Roundabout* music. If this game is intended for younger players it will easily frustrate them. It isn't even clear where you start building the house!

One nice touch though each game ends with Zebedee saying "Time for bed". Pity there wasn't more time for development before that though.

John Minson

the internal registers are displayed.

Anyone writing or learning 6502 machine code will find *Dbug* a worthwhile aid.

Vic Fielder

Storm Warrior leads the pack

IN THE NEWS

Front Runner

Warrior is a game that is to be seen somewhere in the charts.

Computer Trade Weekly

One of those little gems, occasionally full of atmosphere and originality. – Bryan Skinner.
Personal Computer News 22/9/84.

Lots of original thought, playable as well as challenging. We have here – amazingly – a new concept. I don't think anyone will bore with this one quickly. – Bob Wade, Samantha Hemens and Chris Anderson.

Personal Computer Games November 1984.

This warrior should brew up a storm amongst games players everywhere. Definitely worth buying.
Computer & Video Games November 1984.

This game's superb sound, graphics and fighting sequences set it well above the others.

releases ☐ Yes ☐ No Please allow 21 days for delivery

Could this be the biggest selling disc since White Christmas?

A few months after its release, the latest disc from Lotus™ is now romping up the charts.

Symphony™ is the follow-up to that other catchy number, the Lotus 1-2-3,™ itself the biggest selling integrated software disc of all time.

But Symphony's success isn't altogether surprising. It takes the proven benefits of 1-2-3 then adds a few ideas of its own.

The spreadsheet, for instance, is even bigger (8192 rows by 256 columns, to be precise).

The database is even better. Its graphics verge on the artistic (bar charts, line charts, not to mention exploded pie charts). All in colour.

Next, Symphony throws in word processing that matches the speed and the power of any popular WP program.

It adds communications that let you chat with computers anywhere.

And to cap it all you can put everything on the screen at the same time.

So that when you change the numbers in one window the graphics change in another.

But for all this, Symphony is easier to learn and simpler to operate than programs that do half as much.

To find out more about Lotus Symphony and the name of an authorised dealer call Teledata on 01-200 0200.

It may not capture hearts in quite the same way as Bing's disc, but for millions of executives it'll be music to their ears.

Lotus™ 1-2-3™ and Symphony™

SYMPHONY AVAILABLE FOR THE IBM® PC AND XT™, COMPAQ™ AND 100% IBM COMPATIBLES. 1-2-3 AVAILABLE FOR THE IBM PC AND XT, COMPAQ, ACTAPRICE™, OLIVETTI™, M24, 100% IBM COMPATIBLES, DEC RAINBOW™, WANG® PROFESSIONAL™ AND TI PROFESSIONAL COMPUTER™.

Hardware Review

Digital vision

Hardware *Microsight 1 Micro*
Commodore 64 **Price** £500 **Supplier**
Digithurst, 20 Leader Hill, Orwell,
Royston, Herts SG8 5QH

If you ever need to copy an image of a real object on the screen of a Commodore 64, then there is a new peripheral available that could be the answer to a prayer. The Microsight 1 system from Digithurst comprises of a video camera, interface and software that can transfer the output of the camera to the high-resolution screen. The system is not cheap, however, costing £500 or about £350 without the camera.

On receipt of a reset signal from the computer the Microeye interface begins the digitising process. For each incoming line of video a sample of the brightness level is converted to a parallel signal and

passed to the computer's user port. Initially the left-most pixel is read, so after a screenful of lines have been processed the computer holds information on the left-hand row of the screen. The interface repeats the process for pixels from further across the screen until, after five seconds, a whole frame has been stored.

The CBM version of Microsight uses about half of the information produced by the interface, and takes 12k of memory to store it: the resolution is 128 by 100 lines, with 16 levels of brightness. There are two display modes, with a third promised: the first gives a small binary image to help set up the camera, while the full screen mode provides four shades with the aid of bit image techniques. Unfortunately, only 256 of the 320 pixels available are employed, which leaves a black bar on the right of the frame. The final option will use the multicolour mode.

The results I obtained were varied; if sufficient time was spent adjusting lighting and two variables, Threshold and Brightness, then the pictures could be impressive.

Camera shading made adjustments even trickier. I had limited success capturing still frames from a VCR; the interface only decodes about 60% of the picture.

The software provided was still at the prototype stage: a printer dump for Epson printers was included, and a save option and export routine, to pass the screen to a graphics program, are promised. Well-heeled CBM owners who use their machine for complex graphics applications will find the Microsight 1 opens up some intriguing possibilities.

Jeff Naylor

Interface

Hardware *Turboprint/GT Micro*
Commodore 64 and VIC **Price**
£65 (optional 16k buffer £65) **Distributor**
Norbrain Micro Ltd, Boulton
Rd., Reading, Berkshire

Hot on the heels of the Micrografix printer interface for the Commodore home computers (reviewed PCW No. 38) comes the Turboprint/GT from the American manufacturer Telesays. Offering the ability to print text on any printer having the almost universal Centronics input and all the Commodore graphic characters to

most dot-matrix printers, Turboprint/GT takes advantage of a gap left in the market by Commodore.

Anyone owning a Commodore computer and having access to a non-Commodore printer, at work, at school, or somewhere else, will know the frustration of the lack of a standard printer output on the C64/VIC 20. Turboprint/GT gets over this problem in a sophisticated yet very practical way. The interface plugs into the Commodore serial port (on the computer or the disk drive) at one end, just like a Commodore printer, and outputs through a full 36-pin Amphenol (Centronics) plug the other. In between sits a neat box housing its own 6502 processor, Rom, and communications electronics.

Perhaps the most vital part here is the Rom. It is this which lets the interface drive almost any dot-matrix printer and produce the special graphic characters. Just select between the built-in options using some tiny DIP switches, plug the interface in and

forget it. Turboprint/GT takes no Ram but by sending commands by software you can choose one of a number of print modes, including Commodore-copycat, universal-printer, and special-lister (my descriptions). These let you use your printer as if it were a Commodore printer, let you use any special facilities built into your particular printer, and list out programs with all the graphic characters replaced automatically by readable equivalents.

Printout is clear but a little on the slow side if the optional buffer is not used. The interface is compatible with most (possibly all) commercial software, although a little care may be needed to set up the interface correctly before running the software to get the best out of it. I had trouble using the test interface with Compuert which may indicate a possible weakness in timing. I was not using the optional buffer. The documentation, which includes a program for producing a high-resolution screen dump, is good in parts but could be made much clearer in others, particularly for a user not already familiar with Commodore printers and the facilities available. One last problem, the version which I used had only one significant fault, it would not print a sign. Otherwise a good product.

John Cochrane

Prizes to be won valued up to

£40,000

QUO VADIS

Britain's number one best selling CBM 64 game (Gallup) has now got an even bigger prize to be won. If the winning entry is received in The Edge offices after the 100,000th copy of the game has been sold, then the winner will receive not only the Quo Vadis Sceptre (estimated value £10,000), but also £30,000 in cash!

Also for the CBM 64 from The Edge:

Fire Quest

... what a splendid entry into the market
... most impressive animation ... almost cinema cartoon quality ...

With more games of this quality,
The Edge are going to be a force to reckon with.

How to teach your Micro a thing or two

Thousands of home computer owners have yet to discover their microcomputer's potential to help with many of the problems and decisions that come up every day in the home or office.

Perhaps you have always promised yourself that you would teach yourself programming, but have been put off by manuals which seem to assume a lifetime spent studying computer science and mathematics. Maybe you have looked at other computer books, but have yet to find one which is free of unnecessary jargon or where the program examples bear some relevance in real life and not space invaders.

Relax, your search is over.

The 'Learn BASIC' tutorials from Logic 3 are the latest development of a teaching method pioneered by Professor Andrew Colin and perfected

by testing on 3 generations of students at Strathclyde University. The 'Strathclyde Medical' has been translated into 8 languages and used by over 300,000 microcomputer users.

'Learn BASIC' is a jargon free, step by step, course in computer programming, which explains everything clearly in English, not computer talk. In a matter of hours you will be writing your first programs.

'Learn BASIC' is designed for people who want to keep abreast of the computer age, for people who realise that understanding computers is a key to future success at work, in school, and as a parent.

Get 'Learn BASIC' and teach your micro how to be useful! (Available from major branches of W.H. Smiths, Boots, Laskys, Greens, John Menzies and better computer shops nationwide.)

Beating the system

You can beat the system with this housekeeping utility by
Malcolm Davison

One of the weaker points of the QL is its rather ponderous operating system. Expressions such as:

Delete Mdv2—Name—Fill
Copy Mdv1—Name—Fill to Mdv2—Name—Fill

All this to overwrite a previous backup file on the other Microdrive! Then again, if you want to list your Microdrive file directory to a printer:

Baud 1200;Open#5; "Sere"Dir #5; 'mdv1'

As a result of struggling with QDOS, occasionally mistyping when trying to do my backups at the end of a long tiring programming session, I decided that I would have to write a program to handle the more usual operations, in the simplest way I could devise. I hope its length will not deter you from giving it a try.

The first and only demand the program makes on the user is that the 'master file', whose file directory you wish to examine, or

that requires file deletion, or contains the files that you wish to copy is resident in Mdv1.

The system allocates a number to each file on the directory which can be scrolled on the screen with the number adjacent to the file name, and what's more, the display can be paused, and restarted whenever you like or you can return to the menu at any point during the scrolling. You simply note the numbers on the files, say those you wish to delete, and having selected either the delete or copy option, entering the numbers is all that is required to complete the operation. The file name is displayed before the operation proceeds and there is a chance to pull out if you have selected the wrong number.

I decided against allowing copying into the master file for the very simple reason that mistakes were less likely if you physically have to switch the cartridges and Run

the program again; besides, practice, housekeeping operations are normally only 'one way'. So it is best to keep a copy of the program resident on all your Microdrive cartridges.

The program's coding makes use of windows, which make programming very tortuous, but in return for the effort make business programs appear very slick, so that you can, for example, display text and an index in separate scrolling windows. Channel numbers, which are assigned to each window and peripheral device, have to be quoted for every Print, Ink, Paper or CLS statement. The following are the channel numbers used in the program.

Channel #5 Serial printer port
Channel #6 Mdv1 file called Direct
Channel #7 Heading window block
Channel #8 Remaining screen window
The windows are defined in the procedure window, the size, channel numbers, ink and paper colours are assigned, and the windows individually cleared.

The directory of files is first stored to a temporary Microdrive file called direct. The procedure look is then used to load a string array, once the names are stored in the array and the Microdrive file is deleted.

```

The procedure *menu* then handles procedure calling, subject to the user's selection. The *Select On* command usefully handles the conditional selection of the four procedures and an exit option.

The procedure *filelist*, not only lists the contents of the array alongside the number of the file, but it also calls a pause routine called *try*, which causes a continuous loop within *loop2* until a second key depression is detected by the *Inkeys* command. The use of the escape key is only operational when the directory is scrolling, and causes an early return to the menu.

The *write* procedure opens the printer channel and dumps the directory onto the printer, but without the assigned file numbers.

The *del* procedure, similar to the *copyfile* procedure, requests the file number, displays the file name, and on receipt of a confirming Y, proceeds with the file operation. Note that when copying a file to *Mdv2* it deletes a file of the same name, whether one exists or not, the reason being that if a file of

the same name existed it would prevent the *Copy* from being put into effect. An alternate, but long winded, way would be to dump the file names on *Mdv2* to a file, checking for its presence and giving the user an option to abort the option. On the grounds that he wouldn't be doing it if he didn't mean it, I opted for the simplest solution, of overwrite and be damned.

Save the program by typing *ssave*. You can run it by typing: *Lrun Mdv1Dir*. After a delay of twenty seconds or so you can take the list to screen option on the menu, make a note of the file numbers and select the relevant operations you wish to tackle. The directory scroll and pause facility is a pleasure to use after QDOS.

It takes a little while for a user of Sinclair Basic, or any other form of Basic to get used to the idea of 'coercion'. You will find it practised in this program, on lines 3087 and 6025. While it has its advantages in obviating the use of *Strs* and *Val* statements, it

causes a new problem with *Input* statements. Although you may specify a numeric input variable, SuperBasic will allow the input of non-numeric data, so you have to provide a numeric check routine to prevent the program crashing, in terms of coding length, you are worse off!

While writing programs in SuperBasic you will frequently be wanting to save and list your 'baby'. This can become very tiresome if you type the command in each time. I include the procedures called *'ssve'* and *'list'* I used for the development of the program above. You may have to amend the baud rate and the *Open* command to suit your own printer configuration.

Another custom amendment is to change the colour of the screened program listing, the black lettering on white is too glaring on a monochrome monitor, so the procedure *screen* improves this situation. Channel #2 is the program listing window, and channel #1 is the program output window.

When typing in the listing, remember to replace 'I' with '\$'.

FOR DRAGON AND TANDY USERS

SATURDAY 17TH AND SUNDAY 18TH NOVEMBER

10 A.M. UNTIL 6 P.M.

THE ROYAL HORTICULTURAL HALLS

If you own a Dragon or Tandy colour computer this is **your show**.

The **first ever** show organised in the United Kingdom for these machines.

All the very latest **hardware, software, interfaces and peripherals** will be there. Your chance to get up to date, try and buy all **that's new**.

We'll also be organising events and competitions with **great prizes**. The manufacturers will be staffing **advice centres** to help with all your queries.

Exhibitors will have **special offers** on their products so you can **save money too!**

Large gangways and comfortable rest areas will make sure you can see everything and sit in comfort when you want.

This will be a show for the **whole family**, plenty to see and plenty to do.

If you want to miss the queues just clip the coupon below.

Computer Marketplace (Exhibitions) Ltd. Part of the Rushworth Dales Group, 20 Orange Street, London WC2H 7ED.

HOW TO GET THERE

The Royal Horticultural Halls are just off Victoria Street a few minutes walk from Victoria or Parliament Square.

Buses 11, 24, 29, 70, 76 and 88 run up Victoria Street.

Mainline stations; Waterloo, Charing Cross and Victoria.

Underground stations; St. James park (District and Circle lines), Victoria (District, Circle and Victoria lines).

There is an NCP car park in Abingdon Street, a few minutes away.

To: Computer Marketplace (Exhibitions) Ltd, 20 Orange Street, London WC2H 7ED.

Please rush me ____ (qty) adult tickets at £2 each and ____ (qty) tickets for under sixteen year olds at £1 each for the 6809 colour show. I enclose cheque to the value of £_____

Work your way through the most challenging track and field events. As you gain experience and confidence you begin to excel in the four exciting events: 100 metre sprint, 110 metre hurdles, long jump and pole vault.

Here's your chance to be part of the winning team. Put yourself against the clock and beat the record.

Sports Hero includes:

- ★ Multi level competition
- ★ Spectacular graphics
- ★ Smooth animation
- ★ Real time action

Can you surpass your personal best!

Melbourne House

A moving introduction

Animate your loading screens on the Spectrum 48K with some help from Tony Dexter

Most games we buy give us a pretty picture to watch while the main code is loaded from cassette to micro. The Spectrum's *Screens* facility makes it an easy task to save and re-load a full screen picture for this purpose and the process has been frequently described. What is not generally known is a technique whereby a degree of animation can be given to these loading pictures.

The method uses the Attribute file, and the *Flash* function. When *Flash* is set to 1, or switched on, then any particular character will alternate between the *Paper* and *Ink* colours, giving a flashing effect. We can cunningly use this mechanism to build movement into our pictures.

The basic idea can be understood if we think of a single character square in the centre of the square set to, say, *Ink 1* (blue) and *Paper 6* (yellow) with all the surrounding squares set to *Ink 6*, *Paper 6*. If *Flash* is on, then a blue square will repeatedly appear and disappear, but since *Ink* and *Paper* colours are the same for the background area it will not be apparent that the whole screen is flashing.

If we now change the attributes of an adjacent character square to *Ink 6*, *Paper 1* we will find that our little square no longer

appears and disappears — it now jumps from one position to another.

It is from this simple idea that we can go on to create quite elaborate effects. We are limited, of course, since we can only use the Attribute file. All our designs must be built up from full character spaces (*Chr* 32). In fact we will be building two different screens, one made up of solid *Paper* coloured squares, the other of *Ink* coloured squares. This means that the actual design will be somewhat stylised, but can be effective for all that.

If you type in the *Data* lines 10 to 80 and lines 500 and 510 and *Run*, you will see the method applied to lettering. One word of a title will change to another. Type in and *Run* the full listing and you will see the full possibilities of Colour change, Shape change and Movement which this technique offers.

The design should be planned as two separate pictures. The easiest way is to plan *Picture One* on squared paper using coloured pens, making a note that all colours on *Picture One* are *Paper* colours.

Picture Two is similarly planned, but in this case all colours are *Ink* colours. If the two pictures are now compared, character square by character square, we have an *Ink*

colour and a *Paper* colour for each square. Any square which is to alter will have a different *Paper* and *Ink* colour. Any square which is common to both *Pictures One* and *Two* will have the same *Ink* and *Paper* colours.

You can actually put your design on screen by a long series of *Print* statements, or use one of the published or commercially available graphic design programs. Your finished picture should not be *Saved* with *Screens* since this *Saves* both the *Display* file and the *Attribute* file and we are here only concerned with the *Attribute* file.

Save by *Save "name" Code 22528, 768*, and load by *Load "name" Code 22528*.

This gives us an additional bonus in that the loading time is quite noticeably reduced. A full screen picture saved by this method will reload in something like five seconds, while *Screens* takes around 45 seconds.

If we do not mind losing this speed advantage we can combine conventional screen design with the new method. Our animated area can be limited to a part or window of the screen. This area will use attribute design and each square set to *Flash 1*. The rest of the screen can be drawn to pixel definition in the usual manner, with *Flash 0*. In this way we can have a detailed picture, with a less detailed portion animated. Since the *Display* file must now also be saved we use *Save "name" Screens*.

This technique offers great possibilities for experiment, the results being most rewarding.

```

MUSIC MICRO PLEASE!!

AVAILABLE FROM ALL DEALERS. FURTHER INFORMATION: 0115 0832 334000.

LVL's ECHO is a high quality 3-octave keyboard of 37 full sized keys operating electronically through contact closed contacts. The keyboard which is directly connected to the user port of the computer does not require an independent power supply unit.

The ECHOSOFT Programme "Organ Master" written for either the BBC Model B or the Commodore 64 supplied with the keyboard allows these computers to be used as real time synthesizers with full control of the sound envelope. The pitch and duration of the sound envelope can be changed whilst playing, and the programme allows the user to create and allocate his own sounds to four pre-defined keys.

Additional programmes in the ECHOSOFT range are in the course of preparation and will be released shortly.

Other products in the range available from your LVL Dealer are:

ECHOKIT (£4.99) - External speaker adaptor kit, allows your Commodore or BBC Micro computer to have an external speaker socket allowing the ECHOSOUND Speaker amplifier to be connected.

ECHOSOUND (£49.95) - A high quality speaker amplifier with a 6" speaker and a full range output will fill your room with sound. The sound frequency range allows the tone of the sound output to be changed.

Both of these items have been specifically designed to complement the ECHO keyboard.

The ECHO PRODUCT FAMILY breaks both the quality and PRICE BARRIERS, representing outstanding quality and value for money.

"Here, what's that then?"

"What?"

"That ad just now. We just said 'Brian Bloodaxe'."

"Oh, that. That's a 'Teaser', that is."

"Oh yeah, what's that then, a teaser?"

"It's like when you tell 'em something about something, and then tell 'em
a bit more later."

"Clever that, real clever."

"Yeah."

What's New For Christmas? See For Yourself

WIN A COMPUTER AND

The Christmas ZX MICROFAIR

GO ON A SHOPPING SPREE FOR ALL YOUR
NEW SPECTRUM AND QL GOODIES!
— MANY AT SPECIAL SHOW PRICES —

TWO FANTASTIC DAYS

17th and 18th NOVEMBER 1984
AT ALEXANDRA PALACE, WOOD GREEN, LONDON N22.

ADMISSION ONLY £1.50 (Adults) £1.00 (Kids)

Come along on Saturday or Sunday 17th and 18th November to
the Show that shows you everything for Sinclair Computer
enthusiasts!

Why spend weeks looking for Christmas presents... one day at
the Christmas ZX MICROFAIR will take care of everything!
And you'll have a fantastic day out... meeting friendly people...
having fun... full of Christmas cheer!

Send now for reduced price advance tickets — and don't forget to
note the date!

By Road
Follow signs from the A1 (links with M1 and North Circular). Plenty of parking space available.
Variety of routes from Central London.

Free shuttle service to Exhibition —

By British Rail
From London (Kings Cross or Moorgate) — about every 10
minutes to Alexandra Palace station. Free shuttle bus to
show walk from there.

HISOFT ULTRAKIT £9.45

The most powerful toolkit yet for ZX BASIC. All the features you will ever need: AUTO insert, full RENUMBER, block DELETE, CLOCK, ALARM, error trapping, break trapping. Full TRACE with single-step and much, much more. Makes ZX BASIC easy-to-use and powerful.

DEVPAK £14

An excellent assembler, an advanced line-editor, a comprehensive disassembler and a superb 'front panel' debugger all in one package. Used by many leading software houses to write their games. "Buy it!" Adam Denning 1984

PASCAL £25

A powerful and almost full implementation of Pascal - not a Tiny Pascal. A valuable educational and development tool. Programs typically run 40 times faster than a BASIC equivalent. Spectrum version includes Turtle Graphics package. "I haven't seen any other compiler that could match Hisoft's Pascal"

All prices, UK delivered, relate to 48K ZX Spectrum versions

FONT 464 for the AMSTRAD CPC 464

FONT 464 is a font designer and character generator especially developed for the CPC 464 microcomputer.

Design your own character fonts and graphic symbols with this very friendly and powerful package.

FONT 464 allows you to create a new design or amend an existing one using set, reset, invert, reflect, rotate, inverse and even animation!

Load and save character sets to/from tape, use the new character(s) from BASIC, design your own animated graphics - all this and more with FONT 464

FONT 464 is supplied with three interesting and amusing character sets for you to experiment with.

★ All this power for: £7.95 inclusive ★

We also have available for the Amstrad CPC 464:

Hisoft Devpak - our full Z80 assembler and disassembler/ debugger with more features than you'll ever need

Hisoft Pascal - a virtually full implementation of Standard Pascal. Compiles and executes incredibly quickly.

Please write to Hisoft for more details of Pascal and Devpak on the CPC 464 or contact Amsoft with your order.

"They didn't."

"Didn't what?"

"They didn't add nothing like."

"To what?"

"That there teaser we was just talkin' about. They just said 'Brian Bloodaxe' again."

"Didn't add nothin'."

"Ah. Given that. That's the 'Penguin Technique'."

"Penguin Tech. Tech. Tick. What's that then?"

"Well, that's when you do it in black and white and leave 'em on ice."

"What, like tell 'em no more yet mean?"

"Precisely."

"What nothin'? Not even who it's by, the price, nothing?"

"Nope, nothing."

"Not even a clue or some?"

"Well they might say something like 'Makes 'Wet Set Jelly', sound like a computer game."

"Yeah, but nothin' else?"

"Nope."

In control

On-screen printing without control characters (or tears) for the CBM 64 by Peter Graves

One of the drawbacks of Commodore 64 Basic is the lack of simple cursor positioning commands corresponding to *Print* found on other machines. The cursor can be positioned with strings of cursor control characters but this is clumsy and inconvenient.

Anything other than simple screen formats need careful counting of cursor characters from the last printing position or sending the cursor home followed by new strings of characters. However, hidden away in the Rom is a cursor positioning routine that can be accessed by machine code programs.

The routine considers that the screen is made up of 24 rows, numbered 0 to 24 from top to bottom, and 40 columns (numbered 0 to 39) starting from the left hand side of the screen. Thus, the first print position in the top left hand corner is row 0, column 0. The top right hand corner is row 0, column 39 and so on.

The Basic program below consists of three parts, the first *Poke* is a short machine code program into memory locations starting at 49164. These locations are not used by the Basic program. The second part

(Lines 150 to 270) demonstrates the use of the *Plot* program and the third part (starting at Line 1000) is the subroutine that transfers data to the machine code program, then uses it in conjunction with the internal cursor positioning subroutine to actually position the cursor.

Suppose we wanted to start printing a message at row 6, column 14. This is the *Plot* heading in Line 180 of the main program. In front of the *Print* statement another line is inserted (Line 170) of the form: R=(row number); C=(column number); GOSUB (line number where subroutine starts). In our program this is: R = 6; C = 14; GOSUB 1000. The subroutine starting at Line 1000 *Poke* the row and column numbers into locations 49152 and 49153 respectively. It then calls up the machine code program (Sys 49154) which loads the row and column numbers into the X and Y registers respectively of the microprocessor, clears the carry flag (a prerequisite of the internal subroutine operation), then jumps to the internal routine at hex \$FFF. This positions the cursor from the data in the registers, then jumps back to the machine code program, which in turn returns control to the Basic

program via the *Return* statement at Line 1060.

The main program also uses this technique to position the messages associated with the *Input* statements that call for row and column numbers. An asterisk is printed at the cursor position to these numbers to prove that the cursor positioning has been carried out correctly. The machine code program (Lines 100 to 140) and the *plot* subroutine (Lines 1000 to 1060) can be incorporated in any program to allow cursor positioning anywhere on the screen. But take care when positioning the cursor in the last column of row 23 or any column in row 24; the scroll function operates and everything is winched up a line.

Program Notes

Line No	
100 - 140	Read machine code program into locations 49154 to 49164
170 - 180	Position cursor at row 6, column 14 and print message
190 - 200	Reposition cursor for input statement and check if row number input is in range 0 to 24
210 - 220	Repeat for column number input (range 0 to 39)
230 - 250	Clear screen, print asterisk at inputted row and column numbers
260 - 270	Delay to check position is correct then return to Line 160 to start again
1000 - 1060	Subroutine to <i>Poke</i> row and column numbers into correct locations then call up machine code program

```

BRIAN BLOODAXE

With Primary Imbalance

Data Remember

Part One of a powerful filing program by **Peter Patton**

Microfile is a data filing program for the CPC464, which will allow you to create data files with up to 15 fields of 80 characters, which is more than sufficient for most home and small business applications. The program will prompt you every step of the way, but the following points should be considered carefully.

Cassette data files are slow and cumbersome things to use, and for this reason the program holds its entire data file in memory. Data is stored dynamically, that is without waste, so although you may set up a data file in which records can hold up to 750 characters, only the actual characters entered into such records are placed in the file and the unused portion at the end of a data field are ignored.

Each time a data file is loaded into memory, a routine within the program checks to see how much memory space remains, and allocates the correct number of free records available for the current working session.

In order to reclaim the free space it is necessary to *Save* the data file, and then *re-Load* it. This means that if you start a session you may have, for example, room for 100 new records. If you were to enter 20 new records the free record counter would tell you that you have space for 80 more records. However, if you *Save* the file and *re-Load* it again, then the free record counter may tell you that you now have space for 95 records. This does not mean that 15 records have been lost, it merely indicates that that much free space has

been reclaimed. In this way it is not inconceivable that your files may exceed 1000 data records, all of which are held in memory at the same time.

When deciding how your data file is to be structured, you should first sit down with pen and paper, and decide what sections or fields your data can be broken down to, and how many characters the largest single data item will take. In this way you will find that your files are laid out in the way which optimises the storage method outlined above. For example, if you wish to create a file which will hold names and addresses, you may decide that you need these data fields:

- 1 Surname
- 2 First names
- 3 Address
- 4 Town
- 5 County
- 6 Post Code
- 7 Telephone

Having decided that these are the fields you wish to create, you must then allocate space to store this information. If we take field one Surname as an example, it would be all right to allocate 10 characters to this field, if you could be certain that all Surnames to be entered here would be 10 characters or less. However, if you have to enter the name *Higginbottom*, you will end up with the name *Higginbot*. This is because you failed to make allowances for such an eventuality when you created the file.

Similarly, if you think you'll play it safe

and make the fields all of the maximum 80 characters, you will reduce your initial file capacity to some 47 records, thus you will spend much unnecessary time *Saving* and *re-Loading* the file in order to create more free records. So you can see that five minutes with pen and paper, can save many hours of frustration later. A typical example of the same file, structured with care may be:

- 01 Surname (20 characters)
- 02 first names (28 characters)
- 03 Address (40 characters)
- 04 Town (20 characters)
- 05 County (15 characters)
- 06 Post Code (10 characters)
- 07 Telephone (12 characters)

Such a file will now hold over 200 records at the outset, and may well expand to over 400 records, all of which are held in memory and thus are immediately accessible.

Some programmers like to be able to press a single key in answer to a program prompt. Which is fine if the person using the program presses the correct key. My own personal view is that people often press wrong keys, and so you will find that all inputs in this program require you to press *Enter* before any action is taken. This causes little or no inconvenience, and at the same time allows you to change your mind if you select the wrong key.

If at any time you enter a wrong key, it may be cancelled by pressing the *Del* key. However, this is destructive, and will erase any character it passes over, placing a star where the character was. The stars are not a part of the input, so don't worry if you leave them at the end of a data field. If you wish to carry on typing, they are simply typed over. An input ends wherever the cursor is when you press *Enter*.

We are always actively seeking programs for publication — either for Open Forum, the machine pages or Star Game. When sending in a program for consideration, a clear program listing should be sent, together with, wherever possible, a saved copy on cassette. Documentation — usually not more than 1000 words — should start with a general description of the program, what it does, and then some detail of how the program itself is constructed. We pay very competitive rates, according to the length and nature of the program and the quality of the accompanying documentation.

Memory probe

on Vic20

This program works on the unexpanded Vic20, or the expanded (16K) machine and is extremely useful, as it allows one to display on the screen a greatly enlarged version of the characters held in any group

of eight consecutive memory locations. You can use it to probe into the Rom or Ram byte codings.

Roughly it works by ANDing the value peeked at a given memory location with each of the following bit values in turn: 2⁷, 2⁶, 2⁵, 2⁴, 2³, 2², 2¹, 2⁰. (See Lines 158 & 159). If the result is positive (ie, greater than 0) then a character is printed in one of the big

squares, to represent a bit value (Lines 161-162).

On *RUN*ning the program, one is invited to give the first memory position to be studied. The character held in that and the following seven bytes is then printed on the screen together with the addresses of each byte. Pressing function button F7 allows one to study the subsequent eight bytes, and so on.

Arcade Avenue

Dedicated scores

Now that people are getting the message that we have had as many JSW infinite lives as we can handle, I am now getting swamped by a multitude of *Sabre Wolf* pokes — most of which we have already printed. Can I say again, try and hack some more original, or rather less popular, games. Thanks anyway to 'Elvin Iron-monger' of Manchester, Norman Tierney of London, and David McGavin of Erskine in Scotland who has an urge to save gamesplayers from "seven hour stints at games like *Sabre Wolf* that I myself could

not stick to more than half an hour".

Anyway, this week I am going to concentrate on Ultimate games and some scores and tips from people with a greater amount of wholesome dedication.

First off Steven Hunter of Irvine, also in Scotland, has a high, or should I say a low, score of 83050 and 81%. Steven asks if I can reveal anything about the release of *Underworld*, but by the time you read this it should be available together with *Knight Lore*. They both promise to be something special.

Steven's low score has been beaten however by Mr M Mountain of Brighouse who finished with 80,385 and 60%. His tip is to make a map and then only go to areas where there are dead ends to find the amulet. He then goes on to ask, "What does it mean when the natives turn yellow and make a noise?"

The answer comes from Andrew Dunbar of Buckley who

says, "If a native flashes means that it is in line with a nearby part of the amulet but it is not necessarily a short route to it!". He also tips us that every time you collect a piece an extra monster appears, but he doesn't offer a high score of his own.

John Gibson of Sheffield first finished the game with a score of 137,805, but has since achieved a high of 353,295 and 98% which he attributes to having to return to the beginning to find the last piece of the amulet. He has also finished *Atic Atac* and JSW (by cheating) and gives his 'best buy' tips as *Deathchase*, *Codename Mat*, *Jet Pac*, *Am Attack*, *Manic Miner* and *Penetrator*.

Finally Andrew Simmons of Drybrook, who has a score of 104,285 and 78%. Contrary to other letters, he is sure that pieces do not only appear in dead-end clearings and also offers some tips. "To escape the *Sabre Wolf* on the bottom row move quickly upwards into the entrance to a passage

and it will walk underneath. There are three unkillable monsters — the Hippo, Rhino and Warhog. Only the rhino returns when it hits a wall, the others go to sleep and if they are in a downward bend it is possible to get past by moving left and holding 'fire' and 'down'. The warriors appear in different colours, is there any difference?"

I think the answer to the last question is no, unless you are referring to the jaundiced flashing mentioned earlier. He also reveals what happens each time you collect an amulet piece but I think we will leave that for players to discover for themselves.

Tony Kendle

The Arcade Corner is a new section for anyone who enjoys playing arcade games. If you have any comments from playing tips on difficult games or programs you'd particularly like to praise (or blame!) then write to: Tony Kendle, Arcade Avenue, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Scissors

on BBC

Here is a computer version of the old hand

game, Rock, Scissors and Paper. It runs on a BBC B, but could be easily adapted for any machine.

When typing the program in, you must

match up the graphic symbols in the listing with the table below, and type *Shift* plus the appropriate function key to obtain colours and flashing letters.

Microradio

GW6JJN

Do-it-yourself

In true amateur tradition, Microradio goes homebrew and looks at a do-it-yourself way to get your Sinclair Spectrum on the air with Radio Teletype (RTTY).

The Sinclair Amateur Radio User Group (SARUG) at 3 Red House Lane, Leiston, Suffolk IP16 4JZ (SAE with all enquiries) has released details of an RTTY system for the Spectrum which can be purchased as a complete unit already made and set-up or as just the program and the printed circuit board with extensive instructions on how to make it yourself. The unit was initially announced a month or two ago

by SARUG, and Microradio was given the chance to have a go. I have delayed the review until now to see if I could make the unit, with the philosophy that if I can do it anyone can.

The unit was designed by a Danish amateur called Henning Andresen OZ1BH. He also wrote the program for use with the unit, although another piece of software could be used as well, either bought or self-written. The printed circuit board is compact and well-made which gives a feeling of confidence from the beginning. What is remarkable is that this board holds both the terminal unit and the interface making it a complete modem.

Referring to the enclosed component list, I then went about gathering the bits together. Luckily I had some of the components already, but a rough estimate of the component cost would be about £35.

Soldering the components to the board along with various links, etc, was not too difficult provided that great care is taken.

I put the major ICs in sockets which is always worth doing both because soldering large ICs is not the simplest task and because it makes them easier to change if they fail some time. I found that soldering the edge-connector was a bit fiddly, but with patience it was achieved.

Setting the board up to the correct frequencies requires the use of either a frequency meter, an oscilloscope or a frequency checking program. Most people among the amateur fraternity can get access to one of these through a friend or a club, and was simplicity itself.

With the program loaded, I tried it out on air, and - it worked first time. If you are not quite as lucky, the instructions give plenty of help with fault finding. Failing this, SARUG can be called on to help.

On air the unit works very well. In fact, once it is plugged onto the back of the Spectrum it can be forgotten about since all control is handled by the

program. A brief look at the circuit shows serial to parallel conversion is achieved by an 8251A USART chip, tones are modulated by an XR2206 function generator IC and demodulated by an XR2211 FSK demodulator. Where would we be without integrated circuits?

If you want a complete unit made and tested along with the program it will cost you £70. The price of the PCB with the instructions for making the unit is a mere £8, and the software is £10. SARUG point out that they do not supply kits, only either the complete unit already made or the PCB. I found that all the components were readily available from several mail-order firms.

Ray Berry GW6JJN

This series of articles is designed for radio and microcomputer enthusiasts alike. If you have any queries that you want answered, hints and tips to share or topics that you would like to see covered, write to Ray Berry, Microradio, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Open Forum

Barchart

on Dragon

This program draws a barchart for up to 40 values, scaling if necessary. Each bar is shown on the screen, with a name for that

bar underneath. A title is shown, and a mean of the values.

Also included is a short filing routine for storing and retrieving the number sets. The text on the high resolution screen is achieved using the Dragon Draw command in PMode 4.

Program Notes

- 20-300 Intro, input numbers and names.
- 310-680 Draw the bars, title and means.
- 700-1130 Characters
- 1140-1230 Draw characters
- 1240-1340 Input the file
- 1350-1430 Send out file

The Music Box

Midi marathon

The tide of music peripherals and software is beginning to become a flood — in time, no doubt, for the annual ritual of gross indulgence called Christmas.

At Compex this week comes the release of Acorn's long-awaited music system for the BBC — Acorn Music 500, by Hybrid Technology of Cambridge. I shall be reporting on this in a forthcoming column.

Meanwhile, let me note that there are plenty of alternatives around, for the BBC as well as other micros, so don't be cajoled into buying just because of the Acorn name without shopping around first.

The Italian synthesiser company, Siel, makers of the

excellent DK600 polysynth, have completed the conversion of their MIDI step-time sequencer for the BBC. This enables you to use a synthesiser to play compositions made also have a cheap (£449) MIDI synth — the MK900.

The race for such an instrument at a price that can make a synth a convincing peripheral for your computer is on. Front runners are Siel, Casio with the CT101 and Yamaha with the CX5 computer which, of course, includes a fully-fledged synth in the form of a plug-in keyboard and FM synthesis module. Further details of these from: Siel (UK), AHED Depot, Reigate Road, Hookwood, Horley, Surrey RH6 0AY; Casio, Unit 6, 1000 North Circular Road, London NW2 7JD; and Yamaha-Kemble Music (UK), Mount Avenue, Bletchley, Milton Keynes MK1 1JE.

There are yet more peripherals for the Commodore 64 arriving daily — many of which utilise the machine's on-board

programmable sound generator (PSC) to produce all the sound output. The 64 is really becoming the *de facto* standard for musical applications and I shall be dealing with it (as well as other machines like the Spectrum and the BBC) at greater length in future columns. Meanwhile, let me just comment on the brouhaha following Mastertonic's release of their 'Chiller' game, whose musical soundtrack has had to be changed. I've heard the original track, and I must say I found it astonishingly good. Chiller is a sign of things to come. Record companies and music publishers had better sit up and listen.

Mark Cornall has written from Edinburgh asking whether he should buy a keyboard which uses his 64's sound chip or whether he should buy a synth that interfaces to his computer. Well, Mark, your example of the Casio MT-200 is not something I'd choose — you will get far more flexibility and (dare I say

it) better sound from a simple keyboard which allows you to use the 64's SID chip. However, if you've got the money (and it will cost considerably more than the MT-200) buy a MIDI keyboard with interface and a real-time sequencer. Keep reading the column for more info!

Marc Ryan of Sheffield has written with a tougher nut to crack — the problem of interfacing a guitar. This is a altogether bigger question — and I'll leave the answer till next week!

Gary Herman

The Music Box is a new weekly column with news, reviews and readers comments on all aspects of micros and music.

Any readers with experience of computer music making or companies with new product news are invited to write to: drop a line explaining what they're doing to: Gary Herman, The Music Box, 12-13 Little Newport Street, London WC2R 3LD.

The fact that the Commodore 64 is a superb machine hampered by the difficulty of handling sound and graphics from Basic has often been commented upon.

This book presumes a little knowledge of that language and provides a step-by-step analysis of games programming. It emphasises good habits, such as pre-planning and structuring, while it is not afraid to venture into sprite control and sound effects.

The book won't make you a computer whizz-kid overnight but it does provide a clear and friendly introduction to various types of game.

At 400-plus pages it's a good read, but being an American

import it's also expensive.

John Minson

Magazine reviews tend to concentrate on the largest software market, games. Now for the price of one cassette comes a book which could save the parent who is buying educational programs a lot of money which would otherwise be wasted on grade E rubbish.

Sensibly written with the non-expert in mind, the authors do more than provide frank reviews of over a hundred programs for most micros (though check how well yours is catered for in the index). Hardware is also discussed and the need to integrate home learning with the child's school syllabus is emphasised.

This book has a warm and witty approach and fills a gap by uncovering a hitherto well hidden area. It deserves to do well.

When I read the title of this book, I was expecting a beginners guide to 68008 programming, but it's nothing of the sort.

In fact, it's very similar to the QL Advanced User Guide, its main rival, which is itself similar to the Sinclair QDOS Manual.

It starts by covering the processor, though continually refers to it as the 68000, which is rather strange. Then it starts on QDOS, covering the memory layout and usage, though gives only the slightest mention of

few system variables. Following this comes many of the QDOS traps, though it has more missing than the Advanced User Guide, while retaining the same inaccuracies.

There are several substantial example programs included, though some are uncannily similar to those in the book's rival. They were all written using the publishers' own assembler/editor, and two chapters are set aside for the instructions to it, which are purely to fill space, as the program itself must come with the instructions too. It should be made a punishable offence to produce a book of 270 pages with such an unhelpful index.

None of the text has been typeset, but is straight daisywheel output, which in conjunction with the paper used gives it a rather cheap appearance inside. Although it seems to look larger than the QL Advanced User Guide, it contains less information, and is more expensive.

Bill Hoskins

What I want is...

★ what you get is...

LIVELY, PROVOCATIVE AND COMPREHENSIVE INFORMATION, MONTHLY WRITTEN IN PLAIN ENGLISH AND NEVER DULL. **HOME MICRO** KEEPS YOU IN TOUCH WITH EVERYTHING THAT'S HAPPENING IN THE FAST MOVING WORLD OF HOME MICRO COMPUTERS. PLUS IT ENTITLES YOU TO **FREE** MEMBERSHIP OF COPS.

★ join the cops

The Computer Owners Protection Service is the only service of its kind anywhere in the world. As a pioneer owner of a home computer you have already created dozens of millionaires. NOW on your behalf **COPS** will investigate all members' complaints concerning software, hardware, peripherals, publications — anything! And where we find inadequacies, if we don't get your money back WE WILL PUBLISH THE FULL DETAILS **IN HOME MICRO**.

★ SOFTWARE

We print a monthly and unique categorised software 'hit list' so that whether you're an 'adventure', 'arcade' or 'strategy' games player, you'll know which of your type of game is really the best seller. PLUS we print a special NON-GAMES 'hit list' — WE CARRY NO TRADE ADVERTISING, and all our views and reviews are independent and unbiased.

PLACE YOUR 'FREE AD' HERE
(not more than thirty words please)

FREE

THE INDEPENDENT HOME-MICRO NEWSLETTER

★ GOSSIP AND RUMOURS

Nowhere will you find more about who's doing what to whom, success, pending success or failure. Also if you don't know what Sir Clive's nickname was at school or that the new President of Atari was once a New York cabbie: the **Home Micro** Diary Page tells all

★ HARDWARE

We are not a technical journal. But every month we print an 'easy to read' chart that gives you everything you need to know about... what's new, what it does, where to get it and how much. Plus, we offer our own short comments on value and usability. Everything from complete computers to carrying cases is covered.

★ Christmas offer

Home Micro makes a great gift. If you fill in the form below but also tick the box, we will send you a silver-edged 'members' card to be given away on Christmas Day

★ YOUR LETTERS

You write them — we'll print them. Be as critical and hard-hitting as you like. remember as a member of **Home Micro** and **COPS**, you carry real 'clout'. Write NOW

★ TECHNICAL BREAKTHROUGHS

As a computer owner you owe it to yourself to keep abreast in this new technological world. **Home Micro** will not only keep you right up to date, but we will also advise you on how NOT to spend your money on obsolete equipment.

★ A LETTER FROM SIR CLIVE

How would you like to receive a personal monthly letter from such eminent personalities as Sir Clive Sinclair? Every month we invite such people to write to our members giving their views as to how they see the future of the home micro developing

★ free advertising

This is another first for **Home Micro**. All members may place as many 'free ads' for sales, wants and exchanges etc., as they wish and absolutely **FREE**. The **Home Micro** 'Ad' Supplement is distributed to all members monthly with the Newsletter, creating an incredibly effective sales and wants communications network. Or simply enabling member to member contact with fellow enthusiasts. WHY NOT PLACE YOUR FREE 'AD' NOW (see below)

★ PLUS PLUS PLUS

International reports — Diary page of fairs and exhibitions — **MEMBERS DISCOUNTS** — **BEST BUYS** — star prize competitions offering such prizes as... "Ties at the Savoy with the programmer of the game you hate most!"

★ first issue free

One thing's for sure, you don't need a computer to work out that with — **FREE ADVERTISING** — **COPS** — **DISCOUNTS** — **STAR PRIZES** and **INDEPENDENT ADVICE ON WHAT & WHAT NOT TO BUY** — **Home Micro's** new members discount price of just £12 per annum makes a lot of sense and don't forget your first issue is **FREE**

★ WHAT TO DO NEXT

Just fill in the special discount membership form below (send NO money) and you will receive your first issue 'free'. If you don't like it simply cancel your membership before the date printed below and it won't have cost you a penny!

At last, a game all Spectrum owners can enjoy — 24 exciting screens that will prove challenging, infuriating and, even worse, madly addictive!

Sir Lancelot must storm the castle, undaunted by such dangers as birds, bouncing balls, dogs, stars (and even cooking pots with legs??!!).

Your task is to collect the various precious objects scattered throughout the castle — a task that sounds easier than it is.

Great animation and high resolution make this the game to beat.

- Arcade/strategy
- 24 screens
- Up to 7 aliens per screen
- Moving stairways
- Suitable for all ages
- 100% machine code
- For any Spectrum

A Fair Deal For Our Advertisers

No guesses, no wishful thinking – the circulation of this magazine is audited to the strict professional standards administered by the Audit Bureau of Circulations

ABC

The Hallmark of Audited Circulation

Put your micro to work, at home.

If you reckon there's more to your micro than playing games, but you're baffled by word processing and confused by spreadsheets, then take a good long read of Mike Grace's new book.

Home Applications on your micro cuts away all the confusion surrounding the ideas and ideals of the micro at home. It shows you the practical uses, with everyday examples that are within the reach of every micro owner. You'll discover how a database helps you with your domestic chores, and with your hobbies. You'll learn why word processing is worth your while, and how spreadsheets are tailor-made for your personal finances.

This comprehensive, jargon-free book can help you to find out exactly how your micro can help you. Don't leave your home micro without one.

Look out for the Sunshine range at W H Smiths, Boots, John Menzies, other leading retail chains and all good bookshops. Dealer Enquiries: 01-437 4343.

Tony Bridge's Adventure Corner

away as you wish. More serious dangers present themselves in the form of weird monsters who can jump out from a bush just when you are getting complacent.

Tir Na Nog should now be on sale and a more in-depth report will be forthcoming as soon as *The Grand Elf* receives a copy. ■ In the meantime, I think you will enjoy it. Details from Gargoyle Games, 14 King Street, Dudley, West Midlands.

A branch of adventuring which I have always had a fondness for, ■ *Sword and Sorcery*. In fact, this is the forerunner of *Dungeons and Dragons*, which in its turn was the foundation of computer adventuring. So, PSS's latest program, aptly entitled *Swords and Sorcery*, is of great interest. For the Commodore ■ and Spectrum, this program is promised as the first of a series — the character developed in this game can be transferred to subsequent expansion modules. Despite the impression you may gain from the hyperbole of the advert, this is not a new idea, and nor is the idea of "wandering through the unending corridor on a quest for material, physical and/or spiritual power." However, there has been considerable interest shown in this game — again, a *Grand Elf* Report as soon as possible. Details from PSS, 432 Stoney Stanton Road, Coventry.

This week's *Quill'd* game has a special significance for me. *The Quest for the Holy Joystick* is the latest from Delta 4 Software, and is a hilarious, breathtaking romp through adventure-land, swiping as it does at many of the sacred cows of popular computer software. From London, and a dig at *Denis and Roland Prat*, you will go to Level 9 Land, where you can get your own back on the nightingales and Scotland, where you will find a lot of Pokes and cheat programs for something called *Wet for Silly* — then it's down ■ Portsmouth (22 over 7!), then to Europe, and America (all this in just four locations, would you believe!).

My favourite, however (and I hope you'll forgive me for this!), is the trip to Ally Pally.

There, at 'the Umpteenth ZX Microfair', you'll be able to visit a couple of stands. On one of these is a take-off of *Valhalla*, complete with Little Graphics, while on the other you can actually hold a conversation with someone called Tony Bridge! Add to this the title page, which features a couple of adventure in-jokes and a picture of a very strange-looking person, only one or two spelling mistakes and the Beeb-lookalike character set, and you have a wonderfully witty (no silly nudge-nudge humour) adventure, which pokes gentle fun and is a pleasure to play. ■

The only drawback, apart from actually getting stuck in the *Goblin's Dungeon* again (I thought I'd seen the last of that one), is the number of locations — a mere 54. I could certainly have done with many more — come on Delta 4, you've got 14K left to delight us with! Contact Delta 4, The Shieling, New Road, Swanmore, Hants.

Nemesis Software is a company that seems ■ concentrate on games for the newest micro success story — the Amstrad CPC464. They now have two adventures in the Arnold Blackwood series: they are *Trial of Arnold Blackwood* and *Arnold goes to Somewhere Else*. What a wonderful title! As

Pick of the crop

Now the run-up to Christmas is getting into top gear, we adventurers look like being assured the best crop of software for a couple of years.

The *Grand Elf* caught a brief glimpse of *Tir Na Nog* the other day, and was overwhelmed (and not, this time, by PCW coffee!). This graphic adventure from Gargoyle Games, until now known for their arcade hit, *Ad Astra*, ■ set in the 'land of youth' of Celtic mythology. While it owes much to both *Valhalla* and *Lords of Midnight*, the final result is unlike any other adventure and quite startling.

Your brilliantly animated character lopes along through the landscape, all of which is mapped out in a colourful picture in the accompanying booklet. Various objects lie around, waiting to be picked up — there is the obligatory sword and dagger, but there are also things like a needle. What use this might be, I don't know (is it a red herring?); there are also lots of locked doors, the secrets of which will surely need ■ be investigated at some stage. You can wander about past enigmatic buildings and through bewildering mazes, using your on-screen compass and keeping your bearings with the aid of distant landmarks which move slowly past on the horizon. These can be picked out on the map in order to pin-point your position — and all this in fabulous graphics.

To keep you on your toes, several little creatures, the mischievous Sidhe, occasionally appear, and you can fight these or run

I've said before, a good title is often half the battle, and those two ensure a second look. I'm afraid that I don't yet have access to an Amstrad, so I must rely on Nemesis when I tell you that both programs use the maximum Ram, with Save routines, and 160 locations (in the second program at least). Also, say Nemesis, "We haven't yet found a spelling mistake!". Although there are already quite a few adventures already available for the Amstrad, these seem worth a look. Nemesis, ■ Carlow Road, Rings-tead, Kettering, Northants.

This series of articles is designed for novice and experienced Adventurers alike. Each week Tony Bridge will be looking at different Adventures and advising you on some of the problems and pitfalls you can expect to encounter. So, if you have an Adventure you want reviewed or if you are stuck in an Adventure and cannot progress any further write to Tony Bridge, Adventure Corner, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Adventure Helpline

Going bananas? If you are stuck in an Adventure with nowhere to turn do not despair — help is at hand.

Fill in the coupon, explaining your problem.

SEE HEAR
(EDUCATIONAL SOFTWARE)
HEAR IT. SPELL IT. SEE IT.

(CURRENTLY AVAILABLE FOR THE 48K SPECTRUM)

Every tape contains a 15 minute spoken story and a spelling program running together simultaneously on one side of a single tape, which is played on any stereo cassette deck linked by a connecting lead to your computer and headphones.

The first in the series is "A DAY AT THE SEASIDE"; The user is asked to spell words (for example car, train, sea, beach), which are interspersed throughout the story, and each word spell correctly reveals a detailed and colourful picture of that object. A set of free flash cards, with a writing aid is supplied with each tape. All for £9.75

The connecting lead, for use with all tape using the See Hear system is available for £1.95

Send now for despatch by return, to:

Other stories in the series include a picnic in the park and Jo visits the farm

Reserve your Commodore 64 version now, for pre-Christmas delivery.

SINCLAIR QL

(Machine code development programs)

AVAILABLE NOW

CHESS — version 1 of Caesar QL

MONITOR — to allow your own modification to the chess program

EDITOR/ASSEMBLER — a two pass m/code assembler with labels

DISASSEMBLER — allows full listings of all m/code programs

All on one cartridge. £54.95 inc VAT.

This series of programs will allow the user to write his own version of a chess program and thereby challenge the experts.

The assembler and disassembler are included to introduce the user to m/code programming on the Motorola 68000 processor. These programs are easy to use and to work!

STARdataBASE...

The database

for the BBC

STARdataBASE is the fast, machine-code, true random access, database program in 16K ROM for the BBC Microcomputer, complete with over 75K of FREE extension Software.

FEATURES:

- Up to 4096 records in a file
- Up to 69 fields in a record
- Up to 255 characters in a field (subject to an overall maximum of 920 characters in a record).
- An entirely User-defined record layout, including a facility for colour
- Can be used with 40 and 80 track Disk Drives
- Entirely Menu-driven, extremely User-friendly.
- Extremely fast search — A single record can typically be found in 1 second using the Keysearch facility.
- Search conditions include the following: =, <, >, and "Anywhere in the field".
- Powerful facilities to edit records
- Mail-merging between documents created on Wordwise or View, and STARdataBASE records
- Print-out of the whole database or selected Subsets, in the form of Record cards.
- Address label printing — (up to 8 across the page)
- Fully documented routines which can be included in user-written programs and interfaced with STARdataBASE.

STARdataBASE £85.25 inc VAT
Post & Packing £1.75 inc VAT

Video recorder

Edward Plummer of Milton Keynes, writes:

Q I read with interest your answer to S Keating regarding recording programs on a video cassette recorder.

I have a VCR and a BBC B computer, and since I have very little knowledge of recording programs via this method, I would be grateful if you could kindly let me know the following:

- 1) How to go about recording programs on a VCR.
- 2) Are there any books on this subject?

A As you may know, home micros store their programs, and data on cassette tape as 'noise'. Therefore what you need to do is to connect your BBC's cassette input/output leads to the VCR's sound input/output socket.

You may well have to get leads made for this, but this will present no problem, as the plugs at either end are freely available.

I do not know of any books covering VCR as a computer recording medium, but in any case the computer will only treat the VCR as a cassette recorder.

Creating UDG's

R J Burden of Wyke Regis, Dorset, writes:

Q Please could you tell me how to disable the Record on the cassette tape recorder and how to do UDG's on the 16K Vic 20?

A I am afraid that there is no foolproof method of disabling the record function,

without disconnecting the cassette. As long as the correct signals are sent to the cassette port the cassette will be able to be started and stopped by program control.

To create your own UDG's on the Vic, is quite a complex process to explain, so I will confine myself to merely showing you how to do it.

Step 1 — relocate the screen:
POKE 648,30:POKE 642,32:
POKE 36869,240:POKE 36866,150:
POKE 0,108:POKE 1,0:POKE 2,192:SYS(0)

Step 2 — reserve memory:
POKE 52,28:POKE 56,28:CLR

Step 3 — move character set:
FOR I = 7168 TO 7679:POKE I,PEEK(I+25600):NEXT I:POKE 36869,256

Step 4 — create UDG:
10 FOR I = 7432 TO 7439:READ b:POKE I,b:NEXT
20 DATA 60,128,90,126,60,36,102,0

Teacher trouble

M Reynolds of Birmingham, writes:

Q I am a school teacher desperately coming to grips with the micro revolution!

The Birmingham schools have the RML 480Z machines, but these are not within my price range. I have for some time thought of writing to you but feel my question is perhaps a little silly. I have now taken my pen in hand to ask it anyway. Is there any machine in the more modest price range compatible in Basic with the RML machine?

I would like to start a school computer club and would like to recommend a machine for the children so that listings, etc, can be shared. I have a Vic 20 but that has obvious limitations. Am I better advised to wait for the MSX machines, or would say an Amstrad be better? I hope you can catch my drift?

A A cheap micro that is compatible with an RML 480Z, that a child could use... tricky!

I definitely congratulate you on attempting to take the bull by the horns. You are starting off on a very interesting period in your teaching career, if my own experience is anything to go by.

Personally, I would not wait for the MSX machines, as they are likely to be too expensive for the kids to buy. The Amstrad is not a bad idea, but (and I hate to say this), why have you not considered the BBC B, Electron option. The amount of software available for this machine through the education authorities is very large, and the Electron is well within the price range of most people.

Sprite collisions

K B Lo of Southampton, writes:

Q I would like to know how a collision between a sprite and data can be detected, and with what sprite and what data on the CBM 64?

A The CBM sprite system automatically detects collisions between any sprite and any background data. The sprite to data collision register (Hex DOIF) contains details of any collisions that have occurred. This register is organised, and used, in exactly the same way as the sprite collision register (hex DOIE). Remember that once you Peek these registers, they are automatically cleared.

Spectrum compiler

Craig Shorland of Leicester, writes:

Q I recently acquired a compiler for my ZX Spectrum, but was disappointed to find that the compiled code would not run independently of the compiler. This meant that the compiler would have to be loaded each time that I wanted to use any of my compiled programs, and the compiler itself uses 54K.

Could you please recommend some compilers which compile most of the Spectrum commands and do not need to be present when running compiled code.

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem Peek it to Phil Rogers and every week he will Poke back as many answers as he can. The address is *Peek & Poke*, PCW, 12-13 Little Newport Street, London WC2R 3LD

A I have had a number of letters on this subject, and while I sympathise with the points made in Craig's letter, I also understand the software companies point of view.

The main reason that no compiler exists for the Spectrum of the type you require is that the micro compilers are modelled on the mainframe computer versions. What I mean is that when a mainframe program is compiled, in order to run it needs to be able to access routines in the compiler disc libraries. These libraries are not available on machines such as the Spectrum, and so the programmers use the same code (contained within the compiler) to achieve these ends.

You must also bear in mind that Spectrum Basic is non-standard.

Extra commands

S Bennett of Prestatyn, Clwyd, writes:

Q Could you please let me know the name of a Compiler for the Commodore 64 — one that will compile any program into machine code.

I have heard of one called Scope, but you have to learn a further 46 commands to use it.

A I do not know of any compiler for the CBM 64 which claims to be able to handle any Basic statement. It is almost always the case with micro compilers, that there are facilities of Basic that are not supported. Normally this does not present a problem.

If you find a compiler which offers additional facilities to normal Basic, and compiles the majority of standard Basic commands, then I think you would be advised to get that one, and learn the extra commands. You may find that their use will shorten your Basic programs in any case.

Seeing is believing

See the pack—see the screen—see the game.
See the difference the moment you pick up one
of the games from Firebird's new Silver Range.

The difference is that our packs show the high
quality you'll see on the screen when you play,
so you know exactly what you're buying.

The same high standard applies to all twenty
games in the range and all are available at the
remarkably low price of

£2.50

Firebird

SOFTWARE

Here's a sneak look at three of the NEW games:

TERRA FORCE

Terra Man defends the earth against
Ygothulu and his marauding hordes
of Demon Bombers and Solar Pods.

MR. FREEZE

Six freezer compartments to de-ice,
each packed with chilling obstacles,
and each tougher than the last.

HEADACHE

Nervous Ned versus Head Banger in
a furious quest to carry messages
to the brain.

Look out for these games in the FIREBIRD silver range at select high street stores.

SPECTRUM: THE WILD BUNCH, BOOTY, MR. FREEZE, TERRA FORCE, VIKING RAIDERS, MENACE, EXODUS, RUN BABY RUN, CRAZY CAVERNS, BYE BITTEN, VIC 20: SNAKE BITE, MICKEY THE BRICKY
COMMODORE 64: BOOTY, MR. FREEZE, EXODUS, HEADACHE, ZULU, GOGO THE GHOST, BBC MICRO B-BIRD STRIKE, GOLD DIGGER, ACID DROPS, DUCK, EXTRA, THE HACK

The new range from British Telecom.

You'd better believe it!!!

If your computer powers up OK, but doesn't boot, do not worry: there's a hardy PSET in kit for getting this fixed.

If you're having trouble just as you need it, find out the computer, but not at day's notice, then call us: we'll be there very fast (12).

Since parts for other computers are available by post, call us for prices.

POPULAR
Computing
WEEKLY

NEW!

Readers' Chart

Vote each week for your favourite titles

Each week Popular will compile its own special software top ten chart — compiled by YOU

All you have to do to vote for your current three favourite software titles is to fill in the form below (or copy it out on to another sheet if you don't want to damage your magazine) and send it off to: Top 10, Popular Computing Weekly, 12-13 Little Newport Street, London.

To add a bit of spice we will be sending a £50 prize each week to the person who correctly selects that week's top three. If no-one gets it right the £50 will be added to the following week's chart and so on until someone gets it right! (If there is more than one winner that week's prize — whatever the 'pot' stands at — will be split equally between all the correct entries.)

Entries are now being accepted for Week 1. The chart fund stands at £50. Voting for Week 1 closes at 2pm on Wednesday November 21.

New Releases

NATURAL FORM

Jewels of Babylon is Interceptor Micro's best Spectrum game to date — in technical terms at least but also in sheer playing terms (well, unless you loathe adventures).

The plot is nothing new — a fabulous treasure is hidden somewhere on an island, home of pirates. Find it, using a sophisticated communication system of more or less normal English language sentences. Near *Hobbit*-like in fact.

Jewels of Babylon is a graphic adventure and the graphics are really astonishing — beautifully drawn in very hues and displayed instantly. No wonder Interceptor sent us a graphics-only demo to show them off.

The little I managed to play of the adventure impressed me. At the moment I am stuck in a muddy swamp armed only with a shoe and a crocodile that keeps turning up. The way its program understands 'real'

sentences can be pretty confusing — when stuck in a rowing boat which I wished to leave I tried phrases such as Leave Boat and Exit Boat before I realised that the most natural English language form of the request was the correct solution. An excellent program.

Program *The Jewels of Babylon*
Price £8.50
Micro Spectrum
Supplier Interceptor Micro's
London House
The Green
Tadley
Hampshire

really isn't too much to it. A choice of colours and a choice of slightly ropey shapes which can be selected and tested — spelling colours and so on. It appears to be all in Basic and took ages to load. Number one in a field of one, but very bad value just the same.

Program *Shapes and Colours*
Price £14.95
Micro QL
Supplier Key Software
Newlands Daley
Brook Road
Southampton SO3 3AR

and dog control — you are in competition with a rival gunman complete with his own gun and dog.

It's a fun game and the graphics are excellent: the dogs really bounce about authentically — not for hardened Animal Rights or League of Cruel Sports campaigners though.

Program *Gun Dogs*
Price £5.95
Micro Commodore 64
Supplier Hill MacGibbon
92 Fleet Street
London EC4Y 1DH

NO VALUE

Independent software for the QL drifts through in dribs and drabs — mostly drab actually. Next up is an educational program from Key Software. The program intends to teach shape and colour recognition.

Now there isn't anything very difficult about this: show a child some graphics and get it to press the appropriate key — the kind of simple little basic program that might retail for a couple of pounds in the classified. But with the QL there is the awesome question of micro-drives and their price, secondly to be more cynical about it, you can always get away with less for more in the early days of a machine since the competition is that much less.

Key Software's *Shapes and Colours* retails for £14.95 and perfectly exemplifies the principles outlined above — it's not absolutely dreadful, but there

DOG CONTROL

Whenever Andromeda — the Hungarian software company — are behind a program you know you'll get something a little different. Hill MacGibbon have just issued a game, written for them by Andromeda, called *Gun Dogs*.

Gun Dogs is a game in which you blast away at harmless and rather sweet-looking ducks which then tumble to the ground. Then you send your gun dog off to pick the corpse up and put it in your pack. The game is a matter of skillful gun

TYPED IN

Learning to type is something that a computer can definitely help you with. The laborious succession of quick brown foxes can be overlaid by the TV screen telling you how you're getting on and recording each key press.

Pitman Typing is a typing tutor for the BBC B. There are two types of exercises — drilling routines to get used to putting each finger in the right place and a series of sentences which test particular combinations of letters.

At the end of each practice exercise, there is an assessment of your speed and the percentage accuracy. It's a neat, well-designed package but you'll have to pay for it — the cassette is £9.95.

OTHELLO

The *Moors Challenge* sounds like an unusual game but it isn't. Sometime in the life of every new machine a little after *Hangman* and *Chess* you get *Othello*.

Now I haven't got anything against this game — it's quite good fun actually but (let me stick my neck out) it isn't very popular. How many people ring each other up and say 'fancy a quick play of *Othello* tonight' — three or less, that's how many, and one of them is a Shakespearean actor. So why is *Othello* always on a computer? And why is it always one of the first releases? I think we should be told.

The Amstrad now has *Othello* in the form of *The Moors Challenge* (Moor in the sense of swartthy gentleman from foreign parts I suppose). It is an adequate version and quite reasonably priced. You can play against the computer or

another player and there is a demo mode.

SPREADSHEET

You may remember that once upon a time the Commodore 64 was a business machine. That was Commodore's idea anyway, but it never really happened. Games won the day and it's not difficult to see why.

The fact remains that the Commodore certainly is viable as a small business machine and here and there are genuinely serious packages to prove it. The *Micro Swift Spreadsheet* marketed by Audiogenic is operated in a 'pop up' menu style much beloved of trendier and more expensive computers, and has space for a vast number of cell matrices.

The package includes ready prepared 'templates' for some of the most common spreadsheet functions like home budget, car costs, loans and expenses. A small, illustrated manual clarifies those points not obvious from simply using the system.

Pick of the week

3-D WINNER

Cyclone, you will have seen adverts for. Since the *Android* games and *Tornado Low Level*, Vortex have been one of the most interesting Spectrum houses of all. *Cyclone* is the latest program and it hones the three dimensional techniques used in previous games to produce the best ever Vortex game yet.

Cyclone has many similarities with *Tornado* — your task is to pilot a helicopter over a large area of sea and islands all drawn with a three dimensional perspective. Like *Ant Attack* you can change your view of the landscape as if switching to another camera position to see around corners.

The task is to collect and return to base a number of crates; aside from finding them there is the problem of stray aircraft roving about and occasional people requiring help. Worse still is a cyclone which moves slowly around the playing area creating winds which can destroy your helicopter.

From time to time fuel will get low and you'll need to use a special map to help guide you

towards possible landing sites. Landing is difficult but by no means as bad as in TLL. Altogether, what you get is TLL with even more impressive graphics (watch the way the little figures climb up your winch rope when you rescue them) and much increased playability. A winner.

CONVERSION

There are a number of programs, which begin life on one machine (often the Spectrum) and are converted to another (usually the Commodore 64) — it is surprising how often the conversions are unsuccessful. Many's the time when the

Commodore 64 version of a game, has, despite all its superior facilities, actually been worse than the Spectrum original.

I don't know why this should be so — perhaps all the programming effort has been exhausted in creating the original and the new version is just a swap over. I.e. the code is kept as logically similar as possible

rather than rewriting completely using the strengths and avoiding the weaknesses of the machine.

A case in point is Digital Integration's *Fighter Pilot* which is considered a flight simulation program superior even to Psion's original in the Spectrum world. On the Commodore 64 it is a much less impressive program — the two colour screen display (green = land, blue = sky) reduced screen window, lame sound when the facilities could allow for much more, all suggest a program that is not trying as hard as it could.

If you don't have a flight simulator for your Commodore 64 and want one (in particular,

if you want one which lets you stalk and blast baddies) this is by no means a bad program, just a disappointing one.

DIABOLICAL

Now at Sunshine Towers we're a pretty royal lot — the Sunshine enclosure at Ascol is always filled to the brim with Quean fans (always preferred Fritz Lang myself) — the Sunshine ladies can be seen sporting enormous hats and for the gents it's top hat and tails. The nightly sing-song of *Rule Britannia* still brings a tear to everyone from the humblest inkwell filler (a team of small children rescued from the workhouses by Sunshine Charities Inc. a stinking rich non-profit making organisation) to the elusive and near mythical 'Mighty Joe' Sunshine himself — owner of the entire monolithic corporation and several Latin American countries.

Little wonder that a new program, *Di's Baby*, dealing with our own fairy tale Prince and Princess's attempts to bring a new member into the world, filled us all with deep horror and a genuine sense of shock.

How rightly has our popular press voiced the national feeling at this outrage and made *Di's Baby* the object of its righteous wrath.

In this so-called game Charles and Di's private life is revealed as never before, divided into seamy sections with titles like: the joys of parenthood, the conception, the months of waiting, and so on. Personally, I think it is a KGB plot to destroy the very foundations of all that we hold dear and truly British. The people responsible should be put in the tower. Oh, by the way it's a rotten game.

BRAIN HUNT

Along with a new version of *Chiller* (hope you've already got your copy) Mastertonic have issued more titles for the Commodore 64 which they claim are well up to full price standard. *Mind Control* is a platforms and levels game with few extras.

The idea is that you have to negotiate a variety of obstacles to reach the centre of Zyco's brain — this apparently is the only way Zyco (an evil monster) can be destroyed. The game has a lot of wit — the first section involves dodging a series of geriatrics inhabiting Zyco's nursing home.

Their relentless trudge looks

funny but the art of leaping over them proved extremely difficult and I haven't yet made it into Zyco's brain. (I forgot to mention that you have to be miniaturised to enter the brain.)

In short, it seems a satisfactory dodge type game, not desperately original and if it was more expensive I probably would be harder on it, but for £1.99 it's going to give a lot of people many hours of fun.

This Week is a new section that covers all the new software coming on to the home micro market each week. All suppliers should send details of their new programs to: This Week, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Tacky tries

Isaac Asimov noted (in *How Science Fiction Came to be Big Business*, 1980) that *Star Wars* was well photographed, made inspired use of a pair of robots, and was good humoured throughout.

"The result was enormous popularity, unprecedented profits, and, immediately, a host of imitations.

"As usual, the imitations were not as good as the object imitated. Some were too slavish in their imitation. Most chose those elements they saw as money-makers — the special effects — and eliminated what they did not see as contributing — the cleverness and good humour."

Asimov pointed out that if what he termed 'visual' science fiction clings to special effects as the all-in-all, each must exceed its predecessors if it is to be a block-buster and the public will become quickly jaded. He gave the example of the weekly TV series *Battlestar Galactica* which commenced with a high viewer popularity, but which was cancelled at the end of the first season.

Elsewhere Asimov remarked (*The Boom in Science Fiction*, 1979) on the compelling pressures on producers of such films, where "one throw of the dice is the difference between pauperdom and affluence." The result of the uncertainty is that

producers like to deal with things which are considered to be sure-fire, and the seemingly sure-fire approach is more and more special effects.

Many of us have seen the effects of sure-fire special effects in films, with no story attached.

Such antics are now being mirrored in the micro world.

Most of us have seen the effects of sure-fire special effects in computer games, with no story attached. Dressing up — if that is the right phrase — a pretty average computer game of poker with graphics of women who 'strip' still leaves only a pretty average game of poker.

If you want to undress a high resolution woman on the screen as part of some badly programmed game, you deserve pity. Gaining wives by clubbing, and dragging to a cave — as in *BC Bill* — serves to hide another version of the age-old micro game *Kingdom*.

There has been a reaction by games players against the simplistic zap and pow games — not due to any general pacifistic leanings, but through boredom — the games do not offer enough to the player. Tacky tries with tired twists or trite titillation offer no advance.

The point is that there are games which do offer far more than the same old ideas all over again. There is *Deus ex Machina* from Automata. There are the new Braingames from Amplicon (in *Fame Quest* it pays to be chivalrous); and there is *White Lightning* the tremendous Forth games creating system from Oasis Software.

Remember, if a producer runs out of ideas, the easiest ways to ginger up a bad product are special effects, or a bit of sex and violence. And that does not hold merely for computer games...

It applies to films, to computer games, to video, books... anything you care to mention.

Boris Allan

Tommy's birthday

Puzzle No 133

Today is Tommy's birthday, of years he has a score, In other words he's twenty: not a year less or one more.

Now Tommy likes mathematics, and like him you will agree, That the number twenty has this rather curious property.

Twenty is divisible by ten, five, four and two, (We only count whole numbers, cos fractions will not do.)

Now taking these divisors, if we multiply throughout, Their product is four hundred, of this there is no doubt.

Consider well this number, for surprises there are plenty, This total's just the same as you would get by squaring twenty.

The question now arises, is it possible to find, Some other 'ages' that are of, this rather special kind.

The task's not hard...you should achieve a measure of success, But only count those ages, of a century or less!

Solution to Puzzle 128

EVE/DID = .TALKTALKTALK is equivalent to 242/303 = .798679867986.

In the program, which assigns values to EVE and DID, the resulting decimal is checked to determine if the first group of four digits match the second group of four. If it does, and if each of the digits are different from those representing E, V, D and I, the result is printed.

```
10 FOR E = 1 TO 9:20 FOR V = 0 TO 9:30 IF V =
  E THEN GOTO 210:40 FORD = E + 1 TO 9:50 IF D
  = V THEN GOTO 200:60 FOR I = 0 TO 9:70 IF I =
  E OR I = V OR I = D THEN GOTO 190:80 LET EVE
  = E * 100 + V * 10 + E:90 LET DID = D * 100 + I *
  10 + D:100 LET TALK = EVE/DID:110 IF TALK
  >= 1 THEN GOTO 190:120 LET TS
  = STR$(TALK):130 LET Z$ = MID$(TS,3,4):140 FOR
  F = 1 TO 4:150 LET Z = VAL(MID$(Z$,F,1)):160
  IF Z = E OR Z = V OR Z = D OR Z = I THEN GOTO
  180:170 NEXT F:180 IF MID$(TS,3,4) =
  MID$(TS,7,4) THEN PRINT EVE;"/
  "/DID;":":TALK:190 NEXT I:200 NEXT D:210
  NEXT V:220 NEXT E
```

The results are printed with duplicate digits in the decimal part of the answer, or with the fractional part not in its lowest form are rejected by inspection.

Winner of Puzzle No 128

The winner is D P Smith of Hantone Hill, Bathampton, Bath, who receives £10.

The Hackers

It's a sad fact sir, but we're selling a lot of our package for winding-up a business.

So you're not alone. Anyway, it's called 'Insolvency-Calc'...

...but it's only available for the Osborne, the Newbrain and the Jupiter Ace.
